Volume I and II

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e (Pearson)

Module 1 Acid-Base Balance

The Concept of Acid-Base Balance

1) A client who has been fasting and has ketones in the urine is brought to the emergency department (ED) unconscious. Which acid-base imbalance would the nurse expect to assess in this client?
A) Metabolic acidosis
B) Respiratory alkalosis
C) Metabolic alkalosis
D) Respiratory acidosis
Answer: A
Explanation: A) A client who is fasting is at risk for development of metabolic acidosis. The body recognizes fasting as starvation and begins to metabolize its own fatty acids into ketones, which are metabolic acids.
B) A client who is fasting is at risk for development of metabolic acidosis. The body recognizes fasting as starvation and begins to metabolize its own fatty acids into ketones, which are metabolic acids. Starvation would not result in respiratory alkalosis.
C) A client who is fasting is at risk for development of metabolic acidosis. The body recognizes fasting as starvation and begins to metabolize its own fatty acids into ketones, which are metabolic acids. Starvation would not result in metabolic alkalosis.
D) A client who is fasting is at risk for development of metabolic acidosis. The body recognizes fasting as starvation and begins to metabolize its own fatty acids into ketones, which are metabolic acids. Starvation would not result in respiratory acidosis.

WW.TBSM.WS

Page Ref: 5
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.2. Differentiate alterations in acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

2) The nurse is caring for a client in the emergency department. Which factors will the nurse identify that increase the client's risk for metabolic acidosis? **Select all that apply.**
A) Abdominal fistulas
B) Chronic obstructive pulmonary disease
C) Pneumonia
D) Chronic renal failure
E) Hypovolemic shock
Answer: A, D, E
Explanation: A) Metabolic acidosis is rarely a primary disorder. It usually develops during the course of another condition such as an abdominal fistula which can cause the loss of bicarbonate from the intestine.
B) Chronic obstructive pulmonary disease places the client at risk for respiratory acidosis with the increased retention of carbon dioxide in the blood.
C) Pneumonia places the client at risk for respiratory acidosis with the increased retention of carbon dioxide in the blood.
D) Metabolic acidosis is rarely a primary disorder. It usually develops during the course of another condition such as chronic renal failure. In this health problem, the kidneys are unable to excrete a normal amount of hydrogen ions in the urine. This results in an excessive amount of hydrogen ions in the blood, which produces metabolic acidosis.
E) Metabolic acidosis is rarely a primary disorder. It usually develops during the course of another condition such as hypovolemic shock. With a severe blood loss, there is a lack of blood flow throughout the body and a lack of oxygen in every cell. Adenosine triphosphate (ATP) must produce energy anaerobically without the presence of oxygen; lactic acid is a by-product. This produces systemic lactic acidosis, a type of metabolic acidosis.

Page Ref: 5-6
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.2. Differentiate alterations in acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

3) A client with acute asthma has a $PaCO_2$ of 48 mmHg, a pH of 7.31, and a normal HCO_3 arterial blood gas value. Which condition will the nurse associate with these values?
A) Metabolic acidosis
B) Respiratory alkalosis
C) Respiratory acidosis
D) Metabolic alkalosis
Answer: C
Explanation: A) Uncompensated metabolic acidosis has a decreased pH, normal $PaCO_2$, and decreased HCO_3.
B) Uncompensated respiratory alkalosis has an increased pH, decreased $PaCO_2$, and normal HCO_3.
C) If the pH is decreased and the $PaCO_2$ is increased with a normal HCO_3, it is uncompensated respiratory acidosis.
D) Uncompensated metabolic alkalosis has an increased pH, normal $PaCO_2$, and increased HCO_3.
Page Ref: 7
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Essential Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.2. Differentiate alterations in acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

4) The nurse is reviewing the latest arterial blood gas results for a client with metabolic alkalosis. Which result indicates that the metabolic alkalosis is compensated?

A) pH 7.32

B) $PaCO_2$ 18 mmHg

C) HCO_3 8 mEq/L

D) $PaCO_2$ 48 mmHg

Answer: D

Explanation: A) A normal pH level is 7.35-7.45. A pH of less than 7.35 is acidosis.

B) A $PaCO_2$ level of 18 mmHg is low and is seen in respiratory alkalosis.

C) A HCO_3 level of 8 mEq/L is low and is most likely associated with metabolic acidosis.

D) In metabolic alkalosis, there is an excess of bicarbonate. To compensate for this imbalance, the rate and depth of respirations decrease, leading to retention of carbon dioxide. The $PaCO_2$ will be elevated.

Page Ref: 8

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Essential Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 1.2. Differentiate alterations in acid-base balance.

MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

5) A client is diagnosed with chronic obstructive pulmonary disease. Which test provides the most accurate indicator of the client's acid-base balance?
A) Arterial blood gases (ABGs)
B) Pulse oximetry
C) Sputum studies
D) Bronchoscopy
Answer: A
Explanation: A) Acid-base balance is assessed primarily by measuring arterial blood gases (ABGs). Arterial blood is most often used because it reflects acid-base balance throughout the entire body better than venous or capillary blood that has dispersed oxygen into the tissues and has collected carbon dioxide.
B) Pulse oximetry is a noninvasive test that evaluates the oxygen saturation level of blood.
C) Sputum studies can provide specific information about bacterial organisms.
D) A bronchoscopy provides visualization of internal respiratory structures.
Page Ref: 10
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.5. Differentiate common assessment procedures and tests used to examine acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

6) The nurse is instructing a client with a history of acidosis on the use of sodium bicarbonate. Which client statement indicates that additional teaching is needed?
A) "I should contact the doctor if I have any gastric discomfort with chest pain."
B) "I need to purchase antacids without salt."
C) "I should use the antacid for at least 2 months."
D) "I should call the doctor if I get short of breath or start to sweat with this medication."
Answer: C
Explanation: A) The client should be instructed to immediately contact the primary healthcare provider if gastric discomfort occurs with chest pain.
B) The client should be instructed to use non-sodium antacids to prevent the absorption of excess sodium or bicarbonate into systemic circulation.
C) The client should be instructed to not use any bicarbonate antacid for longer than 2 weeks.
D) The client should be instructed to immediately contact the primary healthcare provider if dyspnea or diaphoresis occurs.
Page Ref: 6
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: patient/family/community preferences, values; coordination and integration of care; information, communication, and education; physical comfort and emotional support; involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 1.7. Summarize collaborative therapies used by interdisciplinary teams for clients with alterations in acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

7) A client is receiving sodium bicarbonate intravenously (IV) for correction of acidosis secondary to diabetic coma. The nurse assesses the client to be lethargic, confused, and breathing rapidly. Which action will the nurse take?

A) Stop the infusion and notify the physician because the client is in alkalosis.

B) Decrease the rate of the infusion and continue to assess the client for symptoms of alkalosis.

C) Continue the infusion, because the client is still in acidosis, and notify the healthcare provider.

D) Increase the rate of the infusion and continue to assess the client for symptoms of acidosis.

Answer: C

Explanation: A) The client's symptoms do not indicate alkalosis so infusion should not be stopped.

B) The client receiving sodium bicarbonate is prone to alkalosis; monitor for cyanosis, slow respirations, and irregular pulse.

C) The client continues to exhibit signs of acidosis; symptoms of acidosis include lethargy, confusion, CNS depression leading to coma, and a deep, rapid respiration rate that indicates an attempt by the lungs to rid the body of excess acid, and the physician should be notified.

D) The infusion should not be increased or decreased without a practitioner order.

Page Ref: 5-6

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

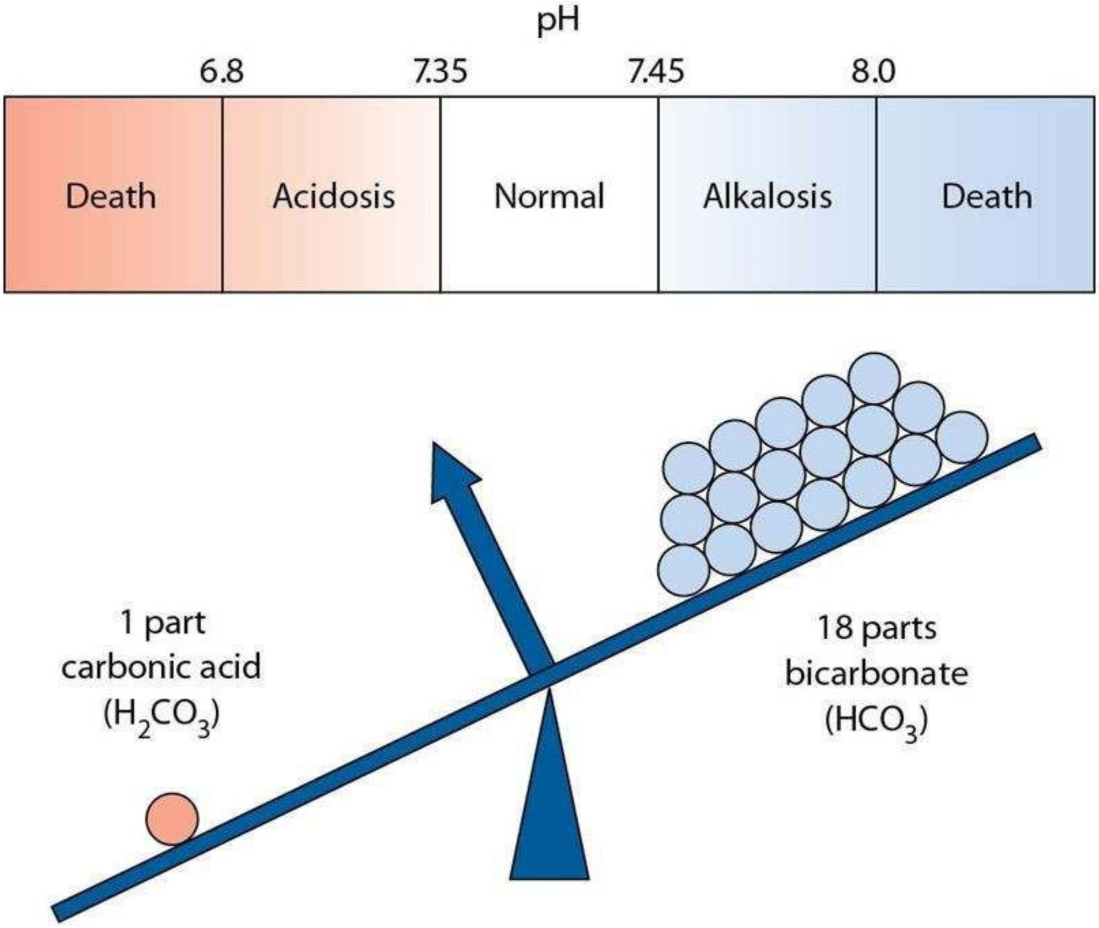
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 1.7. Summarize collaborative therapies used by interdisciplinary teams for clients with alterations in acid-base balance.

MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

8) The nurse is preparing to analyze an arterial blood gas to determine if a client has an acid-base imbalance. In which order will the nurse analyze this laboratory test?
1. Look at the $PaCO_2$.
2. Look at the pH.
3. Evaluate the relationship between pH and $PaCO_2$.
4. Look at the bicarbonate in relation to the pH.
Answer: 2, 1, 3, 4
Explanation: 1. The second step is to look at the $PaCO_2$. If the $PaCO_2$ is <40, then more carbon dioxide is being exhaled. If the $PaCO_2$ is >40, then more carbon dioxide is being retained.
2. The pH is the first step and is analyzed to determine if acidosis or alkalosis is present. A pH of <7.35 is acidosis. A pH of >7.45 is alkalosis.
3. The third step is to evaluate the relationship between the pH and the $PaCO_2$. This relationship could indicate a respiratory problem. If the pH is acidotic and the carbon dioxide level is greater than 40, then the client could be experiencing respiratory acidosis. If the pH is alkalotic and the carbon dioxide level is below 40, then the client could be experiencing respiratory alkalosis.
4. The fourth step is to look at the bicarbonate level in relation to the pH. If both the pH and bicarbonate level is decreased, then the client has metabolic acidosis. If the pH and bicarbonate levels are increased, the client has metabolic alkalosis.
Page Ref: 11
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.5. Differentiate common assessment procedures and tests used to examine acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

9) The nurse is identifying a diagram to use to explain a client's acid-base balance. Which imbalance does the diagram suggest is occurring with the client?



pH
6.8
7.35
7.45
8.0
Death
Acidosis
Normal
Alkalosis
Death
1 part
carbonic acid
(H_2CO_3)
18 parts
bicarbonate
(HCO_3)

A) Metabolic acidosis
B) Metabolic alkalosis
C) Respiratory acidosis
D) Respiratory alkalosis
Answer: A
Explanation: A) In metabolic acidosis, the amount of bicarbonate decreases in relation to the amount of acid in the body.
B) In metabolic alkalosis, there is an excess of bicarbonate in relation to the amount of hydrogen ions.
C) Respiratory acidosis occurs when carbon dioxide is retained, increasing the amount of carbonic acid in the body.
D) Respiratory alkalosis can occur when too much carbon dioxide is lost and carbonic acid levels fall.
Page Ref: 5
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.2. Differentiate alterations in acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

10) The results of a client's arterial blood gas sample reveal an oxygen level of 72 mmHg. For which associated health problem should the nurse assess this client?
A) Stress and coping
B) Perfusion
C) Fluid and electrolyte imbalance
D) Cognition
Answer: D
Explanation: A) Stress and coping may need to be analyzed to determine how the client is coping with the anxiety related to low oxygen levels, but this is not directly a physiological health problem.
B) Perfusion is affected by a reduction in circulating fluids.
C) With a fluid and electrolyte imbalance, there is another disorder affecting acid-base balance. This might not be affected by oxygen level.
D) An oxygen level of less than 75 mmHg can be due to hypoventilation. This drop in oxygen will change the client's level of responsiveness.
Page Ref: 10
Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.3. Outline the relationship between acid-base balance and other concepts.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

11) The nurse is caring for a comatose client with metabolic acidosis. For which intervention will the nurse need to collaborate when caring for this client?
A) Measuring vital signs
B) Measuring intake and output
C) The client's recent eating behaviors
D) Identifying current oxygen saturation level
Answer: C
Explanation: A) Measuring vital signs is an independent nursing action.
B) Measuring intake and output is an independent nursing action.
C) For clients in severe distress, family members may need to be consulted for critical information such as recent eating habits and history of vomiting.
D) Identifying current oxygen saturation level is an independent nursing action.
Page Ref: 12
Cognitive Level: Understanding
Client Need/Sub: Safe and Effective Care Environment: Management of Care
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 1.7. Summarize collaborative therapies used by interdisciplinary teams for clients with alterations in acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

12) The nurse is beginning to review a client's arterial blood gas results. Which ion is measured to determine the pH?
A) Cl^-
B) H^+
C) Na^+
D) HCO_3
Answer: B
Explanation: A) Chloride (Cl^-) concentrations are not related to pH.
B) The pH measures the concentration of hydrogen ions (H^+) in the body.
C) Sodium (Na^+) concentrations are not related to pH.
D) Bicarbonate (HCO_3) is a weak base that is used as a buffer to help maintain the proper pH, but it is not used to measure pH.
Page Ref: 3
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.1. Analyze the physiology of normal acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

13) A client with a suspected acid-base imbalance has an arterial blood gases bicarbonate level of 18 mEq/L. In which way will the nurse interpret this result?
A) Slightly high
B) Slightly low
C) Extremely high
D) Within normal range
Answer: B
Explanation: A) The normal serum bicarbonate level is 22-26 mEq/L. A value of 18 mEq/L is not slightly high.
B) The normal serum bicarbonate level is 22-26 mEq/L. A value of 18 mEq/L is slightly low.
C) The normal serum bicarbonate level is 22-26 mEq/L. A value of 18 mEq/L is not extremely high.
D) The normal serum bicarbonate level is 22-26 mEq/L. A value of 18 mEq/L is not within the normal range.
Page Ref: 4
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.1. Analyze the physiology of normal acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

14) The nurse notes that a client's acid-base balance changes reflect hypoventilation or hyperventilation. On which concept will the nurse focus when planning care for this client?
A) Oxygenation
B) Perfusion
C) Cognition
D) Stress and coping
Answer: A
Explanation: A) Hypoventilation and hyperventilation are related to oxygenation. Respiratory rate helps regulate carbon dioxide pressures, which can contribute to acidosis or alkalosis.
B) Perfusion, does not directly relate to hypo- or hyperventilation.
C) Cognition does not directly relate to hypo- or hyperventilation.
D) Hypoventilation and hyperventilation are related to oxygenation. Respiratory rate helps regulate carbon dioxide pressures, which can contribute to acidosis or alkalosis. Stress and coping do not directly relate to hypo- or hyperventilation.
Page Ref: 10
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 1.3. Outline the relationship between acid-base balance and other concepts.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

15) The nurse is reviewing a client's acid-base balance. Which factor will the nurse prioritize as a health promotion activity?
A) Conducting yearly health screenings.
B) Obtaining immunizations.
C) Beginning an exercise regimen.
D) Maintaining fluid balance.
Answer: D
Explanation: A) Conducting yearly health screenings are activities that can promote health in other areas.
B) Obtaining immunizations is an activity that can promote health in other areas.
C) Beginning an exercise regimen is an activity that can promote health in other areas.
D) Both overhydration and dehydration can result in acid-base imbalances. Therefore, health promotion should focus on maintaining fluid balance.
Page Ref: 8
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.8 Promote self-care management. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.4. Explain the promotion of healthy acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

16) A client needs to have a sample of arterial blood for blood gas analysis. For which reason will the modified Allen test be performed before drawing the blood?
A) Reduce the risk of bleeding or bruising of the arm
B) Determine if arterial puncture can safely be performed
C) Determine the oxygen saturation of the blood in the artery
D) Determine the pressure of the blood in the artery
Answer: B
Explanation: A) The modified Allen test does not reduce the risk of bleeding or bruising.
B) A modified Allen test is a measure of ulnar patency. The client elevates the hand and repeatedly makes a fist while the examiner places digital occlusive pressure over the radial and ulnar arteries of the wrist. The hand will lose its normal color. Digital pressure is released from one artery while the other remains compressed. The return of color indicates that the hand has good collateral supply of blood and that arterial puncture can safely be performed.
C) The modified Allen test does not measure oxygen saturation.
D) The modified Allen test does not measure artery pressure.
Page Ref: 10
Cognitive Level: Understanding
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.5. Differentiate common assessment procedures and tests used to examine acid-base balance.

MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

17) The nurse is caring for a client with an acid-base imbalance. Which intervention will the nurse complete independently?
A) Monitoring intake and output
B) Drawing blood for ABGs
C) Giving sodium bicarbonate infusions
D) Administering oxygen via nasal cannula
Answer: A
Explanation: A) Monitoring intake and output is an independent nursing intervention that does not require a provider's orders.
B) Drawing blood for ABGs is an action that can be performed by the nurse, but must first be ordered by a provider.
C) Giving sodium bicarbonate infusions can be performed by the nurse, but must first be ordered by a provider.
D) Administering oxygen via nasal cannula can be performed by the nurse, but must first be ordered by a provider.
Page Ref: 12
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Management of Care
Standards: QSEN Competencies: II.A.1. Describe own strengths, limitations, and values in functioning as a member of a team. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Teamwork: Scope of practice, roles, and responsibilities of healthcare team members, including overlaps. | Nursing Process: Implementation
Learning Outcome: 1.6. Analyze independent interventions nurses can implement for patients with alterations in acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

18) The nurse is caring for a client with acid-base imbalance. For which reason will the nurse measure the client's daily weight?
A) Monitor oxygenation status
B) Monitor perfusion of organs
C) Monitor renal function
D) Monitor fluid balance
Answer: D
Explanation: A) A client's weight does not reflect oxygenation status.
B) A client's weight does not reflect perfusion of organs.
C) Daily weights can reflect renal function, but weight can fluctuate even if the kidneys are functioning properly.
D) Fluid balance must be maintained to support acid-base balance. If a client rapidly gains weight, it is a sign of fluid overload. If a client rapidly loses weight, it is a sign of dehydration. Both of these conditions can alter the acid-base balance, so a client's weight should be monitored daily.

Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.6. Analyze independent interventions nurses can implement for patients with alterations in acid-base balance.
MNL LO: Analyze the concept of acid-base balance and its application to nursing care.

Exemplar 1.A Metabolic Acidosis

1) A client recovering from cardiac arrest has an arterial blood gas pH of 6.58. Which explanation will the nurse suspect is the reason for this pH level?

A) Increased lactic acid level

B) Decreased carbohydrates for fuel

C) Decreased renal perfusion

D) Increased loss of bicarbonate

Answer: A

Explanation: A) Lactic acidosis is a common type of acidosis in hospitalized clients and develops with excess production or diminished excretion of lactic acid from the blood. Lactic acid is produced by anaerobic metabolism of glucose which occurs in cardiac arrest.

B) Lactic acid would increase in a client with diabetes when there is a lack of carbohydrates to be used for fuel.

C) The low pH that develops after a cardiac arrest is not due to decreased renal perfusion. The change in pH because of renal perfusion is due to an imbalance in bicarbonate level.

D) The low pH that occurs after a cardiac arrest is not caused by a loss of bicarbonate. Bicarbonate loss occurs in severe diarrhea and gastrointestinal disorders.

Page Ref: 14

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Describe the pathophysiology of metabolic acidosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

2) The nurse is caring for a client who has been admitted with persistent diarrhea lasting 3 days. Which problems will the nurse identify for this client during the acute phase of the illness?

Select all that apply.

A) Potential for decreased cardiac output
B) Problems clearing the airway
C) Inability to control urine output
D) Lack of information about the health problem
E) Risk for falls

Answer: A, E

Explanation: A) Metabolic acidosis decreases cardiac output by decreasing contractility, slowing the heart rate, and increasing the risk for dysrhythmias.
B) The client with metabolic acidosis will not have problems clearing the airway.
C) The client with metabolic acidosis will not have a problem with controlling urine output.
D) The client may have a lack of information about the health problem but this is not the priority during the acute phase of the illness.
E) The client with metabolic acidosis is at risk for injury from falls due to altered mental status.

Page Ref: 17

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Diagnosis

Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic acidosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

3) The nurse is caring for a client with metabolic acidosis. Which goals are appropriate for this client? **Select all that apply.**
A) The client will maintain a respiratory rate of 30 or more.
B) The client will describe preventative measures for the underlying chronic illness.
C) The client will maintain baseline cardiac rhythm.
D) The client will remain in a pH range from 7.25 to 7.35.
E) The client will take potassium supplements to increase potassium levels.
Answer: B, C
Explanation: A) The client's respiratory rate should be within normal range for age and condition.
B) Planning for the client with metabolic acidosis involves identification and treatment of the underlying cause and restoration and maintenance of acid-base balance. The client should be able to describe preventative measures for the underlying chronic illness that caused the metabolic acidosis to occur.
C) The client should be able to describe preventative measures to maintain the baseline cardiac rhythm.
D) The pH should be maintained between 7.35 and 7.45.
E) Taking a potassium supplement may cause hyperkalemia, which decreases cardiac output and worsens metabolic acidosis.
Page Ref: 17
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

4) The nurse is caring for a client with renal failure and metabolic acidosis. Which clinical manifestation would indicate to the nurse that planned interventions to relieve the metabolic acidosis have been effective?

A) Decreased respiratory depth

B) Palpitations

C) Increased deep tendon reflexes

D) Respiratory rate of 38

Answer: A

Explanation: A) The client with metabolic acidosis will have an increased respiratory rate and depth, called Kussmaul respirations. Signs that care has been effective would include a decrease in the rate and depth of respirations.

B) Palpitations are not associated with metabolic acidosis.

C) Increased deep tendon reflexes are not associated with metabolic acidosis.

D) An increased respiratory rate, as indicated by a respiratory rate of 38, would indicate continued metabolic acidosis.

Page Ref: 15

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Identify the clinical manifestations of metabolic acidosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

5) The nurse is caring for a client with hypovolemic shock and metabolic acidosis. Which therapies would the nurse question if planned for this client? **Select all that apply.**
A) Monitor weight on admission and discharge
B) Monitor ECG for conduction problems
C) Limit the intake of fluids
D) Administer sodium bicarbonate
E) Keep the bed in the locked and low position
Answer: A, C
Explanation: A) Clients being treated for hypovolemia and metabolic acidosis will require daily weights, not a weight on admission and then discharge.
B) Monitoring ECGs are appropriate for the client with metabolic acidosis.
C) The treatment for hypovolemic shock would include the administration of fluids, not limiting fluids.
D) Administering sodium bicarbonate is appropriate for the client with metabolic acidosis.
E) The client recovering from hypovolemic shock and metabolic acidosis is at risk for injury, so the bed should be kept in the locked and low position.
Page Ref: 17-18
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

6) A client with metabolic acidosis is experiencing confusion and weakness. Which nursing intervention is the priority for this client?
A) Placing the client in a high-Fowler position
B) Protecting the client from injury
C) Administering sodium bicarbonate
D) Providing the client with appropriate skin care
Answer: B
Explanation: A) The high-Fowler position would not be the safest position for the confused client.
B) The client with metabolic acidosis may have symptoms of drowsiness, lethargy, confusion, and weakness. A priority of care would be preventing injury to the client.
C) Medication administration is a physician order.
D) Skin care would not be a priority on admission.
Page Ref: 18
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

7) The nurse is teaching a client with type 1 diabetes mellitus on the mechanism behind the development of ketoacidosis. List the order in which the nurse should provide this information.

1. Production of lactate and hydrogen ions
2. Tissue hypoxemia
3. Breakdown of fatty tissue
4. Reduction in intracellular glucose
5. Fatty acids converted to ketones

Answer: 2, 1, 4, 3, 5

Explanation: Lactic acidosis develops due to tissue hypoxia and a shift to anaerobic metabolism by the cells. Lactate and hydrogen ions are produced, forming lactic acid. Starvation or lack of insulin leads to intracellular starvation of glucose. The lack of glucose or insulin to move glucose into the cells causes the body to break down fatty tissue to meet metabolic needs. When fatty acids are broken down, these acids are converted to ketones, leading to the development of ketoacidosis.

Page Ref: 14

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Describe the pathophysiology of metabolic acidosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

8) A client with metabolic acidosis is at risk for an injury. Which strategies should the nurse use to prevent the client from experiencing an injury? **Select all that apply.**
A) Apply wrist restraints and secure to the bed frame.
B) Discuss chemical restraint use with the healthcare provider.
C) Keep the bed in the lowest position.
D) Keep upper bed side rails raised.
E) Place a clock and calendar at the bedside.
Answer: C, D, E
Explanation: A) Restraints are used in the event the client demonstrates harm to self or others.
B) A risk for injury is not a reason to use chemical restraints.
C) To reduce the client's risk for injury, the nurse should make sure the bed is kept in the lowest position.
D) To reduce the client's risk for injury, the nurse should make sure the upper side rails are raised. Raising all siderails is a form of restraint that cannot be done without a provider's order.
E) A clock and calendar at the bedside will help with orientation.
Page Ref: 18
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic acidosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

9) Upon entering a room, the nurse quickly scans the environment and then immediately assesses the client for manifestations of metabolic acidosis. Which observation caused the nurse to make this assessment?
A) Client sleeping with the head of the bed flat
B) Half of the client's lunch tray uneaten
C) One formed stool in the bedside commode
D) 2000 mL of intravenous 0.9% normal saline infused in 2 hours
Answer: D
Explanation: A) The head of the bed's being flat might influence a client's oxygenation status; however, the client was not demonstrating a change in respiratory depth or rate.
B) A reduction in oral intake does not cause metabolic acidosis. Eating half of a meal tray is not the same as starvation.
C) Diarrhea can lead to the development of metabolic acidosis. One formed stool would not cause the nurse alarm.
D) Excessive infusions of chloride-containing intravenous fluids can precipitate metabolic acidosis.
Page Ref: 15
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Compare the risk factors and prevention of metabolic acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

10) During a home visit, the nurse evaluates care provided to a client with type 1 diabetes mellitus and a history of metabolic acidosis. Which outcome indicates that the care of this client has been successful?

A) The client is injecting insulin into thigh muscle.

B) The client is taking laxatives three times a week to ensure adequate bowel movements.

C) The client is eating three balanced meals per day with two snacks.

D) The client is taking aspirin 325 mg every 6 hours to treat arthritis pain.

Answer: C

Explanation: A) Incorrect administration of medication could cause a metabolic problem in the client with diabetes.

B) The use of laxatives could cause diarrhea, which can lead to metabolic acidosis.

C) Adequate nutrition is necessary to prevent the buildup of acids in the blood.

D) Ingesting high amounts of salicylate acid can lead to toxicity and the development of metabolic acidosis.

Page Ref: 18

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care | Nursing Process: Evaluation

Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic acidosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

11) The nurse is preparing a teaching tool about metabolic acidosis. Which information will the nurse include that explains a common cause of this condition?
A) Hyperventilation in a client with anxiety
B) High blood glucose in a client with type 1 diabetes
C) Vomiting in a client with a gastrointestinal infection
D) Opiate overdose in a client with depression
Answer: B
Explanation: A) Hyperventilation can lead to respiratory alkalosis.
B) High blood glucose that leads to diabetic ketoacidosis is a common cause of metabolic acidosis.
C) Vomiting can lead to metabolic alkalosis.
D) Opiate overdose can lead to respiratory acidosis.
Page Ref: 15

Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Describe the etiology of metabolic acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

12) The nurse is caring for a client with metabolic acidosis. Which assessment finding indicates to the nurse that the client is experiencing a compensatory mechanism to the disorder?
A) Headache
B) Kussmaul respirations
C) Vomiting
D) Decreased level of consciousness
Answer: B
Explanation: A) Headache is a clinical manifestation of metabolic acidosis, but is not a compensatory mechanism that the body uses to maintain acid-base balance during metabolic acidosis.
B) Kussmaul respirations are deep and rapid respirations that are a compensatory mechanism during metabolic acidosis.
C) Vomiting is a clinical manifestation of metabolic acidosis, but is not a compensatory mechanism that the body uses to maintain acid-base balance during metabolic acidosis.
D) Decreased level of consciousness is a clinical manifestation of metabolic acidosis, but is not a compensatory mechanism that the body uses to maintain acid-base balance during metabolic acidosis.

Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Identify the clinical manifestations of metabolic acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

13) The nurse is caring for a client with metabolic acidosis. Which medication will the nurse expect to be prescribed for this client?
A) Sodium bicarbonate
B) Sodium chloride
C) Potassium chloride
D) Dextrose
Answer: A
Explanation: A) Sodium bicarbonate is often given intravenously to clients with severe acute metabolic acidosis. It raises the pH of the blood.
B) Sodium chloride may worsen metabolic acidosis by increasing the chloride concentration.
C) Potassium chloride may worsen metabolic acidosis by increasing the chloride concentration.
D) Dextrose may worsen metabolic acidosis, especially in clients with type 1 diabetes, by increasing blood glucose levels and causing ketoacidosis.

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Summarize diagnostic tests and therapies used by interdisciplinary teams in the collaborative care of an individual with metabolic acidosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

14) The nurse has been caring for a 3-month-old infant with fever, diarrhea, vomiting, and diaper rash over the past 48 hours. Which symptom puts this client most at risk for metabolic acidosis?
A) Fever
B) Diarrhea
C) Vomiting
D) Diaper rash
Answer: B
Explanation: A) Fever does not directly contribute to metabolic acidosis.
B) Infants are more susceptible to metabolic acidosis from diarrhea due to significant losses of bicarbonate in the feces.
C) Vomiting is more likely to result in metabolic alkalosis from loss of stomach acids.
D) Diaper rash does not directly contribute to metabolic acidosis.
Page Ref: 15
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Differentiate care of clients with metabolic acidosis across the lifespan.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

15) An older adult client has a history of heart disease and dementia and takes several medications. An accidental overdose of which medication could result in metabolic acidosis?
A) Losartan (an angiotensin II receptor blocker to reduce hypertension)
B) Simvastatin (a statin to reduce blood cholesterol levels)
C) Rivastigmine (a cholinesterase inhibitor to reduce symptoms of dementia)
D) Aspirin (a salicylate to decrease risk of heart attack)
Answer: D
Explanation: A) Acid-base balance is less affected by angiotensin II receptor blockers.
B) Acid-base balance is less affected by statins.
C) Acid-base balance is less affected by cholinesterase inhibitors.
D) Aspirin is salicylic acid, which could decrease the blood pH if taken in high quantities.
Page Ref: 15
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.4. Examine how the safety, quality and cost effectiveness of health care can be improved through the active involvement of patients and families. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Assessment
Learning Outcome: 1.A. Analyze metabolic acidosis as it relates to acid-base balance. Differentiate care of clients with metabolic acidosis across the lifespan.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic acidosis.

Exemplar 1.B Metabolic Alkalosis

1) A client has been vomiting for several days. Which characteristic of gastric secretions increases the client's risk of developing metabolic alkalosis?
A) Gastric secretions are green in color.
B) Gastric secretions are alkaline.
C) Gastric secretions are acidic.
D) Gastric secretions have a foul smell.
Answer: C
Explanation: A) The color of gastric secretions has no influence on the development of metabolic acidosis.
B) Gastric secretions are not alkaline.
C) Metabolic alkalosis due to loss of hydrogen ions usually occurs because of vomiting or gastric suction. Gastric secretions are highly acidic (pH 1-3). When these are lost through vomiting or gastric suction, the alkalinity of body fluids increases. This increased alkalinity results from the loss of acid and from selective retention of bicarbonate by the kidneys as chloride is depleted.
D) The odor of gastric secretions has no influence on the development of metabolic acidosis.
Page Ref: 20
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Describe the pathophysiology of metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

2) The nurse is caring for a client with congestive heart failure. Which assessment data indicate that the client is at risk for metabolic alkalosis? **Select all that apply.**
A) Takes furosemide (Lasix) daily
B) Takes a baby aspirin once daily
C) Takes metformin daily
D) Uses calcium carbonate (Tums) for acid indigestion
E) Takes acetaminophen as needed for pain
Answer: A, D
Explanation: A) The use of a diuretic to remove excess fluid also increases the renal excretion of hydrogen ions, increasing the risk of alkalosis.
B) Overuse of aspirin can be associated with metabolic acidosis.
C) Use of metformin is not associated with alkalosis.
D) Excessive use of calcium carbonate can cause metabolic alkalosis.
E) Use of acetaminophen is not associated with metabolic alkalosis.
Page Ref: 20
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Describe the etiology of metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

3) An adolescent has been vomiting for several days because of food poisoning. Which information will the nurse include when teaching the parents about the illness? **Select all that apply.**
A) Immunizations for the adolescent
B) Nutritional patterns of the adolescent
C) Signs and symptoms of metabolic alkalosis
D) Proper food-handling techniques
E) Normal laboratory values of the adolescent
Answer: C, D
Explanation: A) Immunizations would not prevent the illness.
B) Food patterns of the adolescent are not the precipitating factor of the food poisoning.
C) The family of anyone experiencing prolonged vomiting should be taught the signs and symptoms of metabolic alkalosis.
D) The nurse would include teaching about proper methods of food handling to prevent further episodes of food poisoning.
E) It is not necessary to teach normal laboratory findings.

Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

WWW.TBSM.NS

4) The nurse is planning care for a client with metabolic alkalosis. Which problems will the nurse identify for this client? **Select all that apply.**

A) Nutritional deficits
B) Altered temperature regulation
C) Potential for fluid volume deficiency
D) Ineffective breathing pattern
E) Fall risk

Answer: B, C, D, E

Explanation: A) The reason for the metabolic alkalosis needs to be identified. Nutritional deficits may not be appropriate.
B) Clients with metabolic alkalosis often have accompanying disorders that would affect the temperature regulating mechanism.
C) Clients with metabolic alkalosis often have an accompanying deficiency in fluid volume.
D) Respiratory compensation for metabolic alkalosis includes depression of the respiratory rate and reduction of the depth of respirations, leading to the retention of carbon dioxide.
E) The client is at risk for injury because of the associated muscle spasms and dizziness.

Page Ref: 22
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

5) A client with Cushing syndrome is experiencing complications from the condition. Which intervention should the nurse plan for this client to improve the impaired gas exchange?
A) Monitor serum electrolytes
B) Schedule nursing activities to allow for periods of rest
C) Assess input and output accurately
D) Administer IV fluids per provider's order
Answer: B
Explanation: A) Monitoring serum electrolytes would address an alteration in fluid volume.
B) The client with Cushing syndrome is at risk for developing severe metabolic alkalosis that causes hypoxemia and limits energy reserves. Spacing nursing activities throughout the day allows the client ample rest time.
C) Monitoring intake and output will address an alteration in fluid volume.
D) Intravenous fluids will address an alteration in fluid volume.
Page Ref: 23
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values.

Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic alkalosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

6) A client with heart failure is prescribed furosemide (Lasix). Which client statement indicates that teaching provided by the nurse was effective?
A) "I will use only sodium bicarbonate as my antacid."
B) "I will restrict my intake of fluids."
C) "I will use potassium supplements while I am taking Lasix."
D) "I will take antacids only for my gastric discomforts."
Answer: C
Explanation: A) The client should be instructed to refrain from the use of sodium antacids when prone to metabolic alkalosis.
B) The client who is prone to metabolic alkalosis is likely to have fluid deficits and would not be instructed to restrict fluids.
C) The client on furosemide (Lasix) may lose excess potassium, disposing the client toward metabolic alkalosis.
D) The client should consult with the primary care provider for gastric distress rather than self-medicate.
Page Ref: 21
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

7) A client is diagnosed with severe metabolic alkalosis. Which action will the nurse prioritize for this client?
A) Administering medication for metabolic alkalosis
B) Monitoring oxygen saturation
C) Teaching the client the risk factors for metabolic alkalosis
D) Setting goals for the client with metabolic alkalosis
Answer: B
Explanation: A) Administering medications will be needed as a treatment, but the priority is to discover the cause.
B) The priority for this client is monitoring oxygen saturation. The depressed respiratory drive that often accompanies metabolic alkalosis can lead to hypoxemia and impaired oxygenation of the tissues.
C) Teaching the client is an important aspect of nursing care but is not the priority.
D) Setting goals is an important aspect of nursing care but is not the priority.
Page Ref: 22

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

8) The nurse is caring for a client with hyperaldosteronism. In which position should this client be placed to enhance gas exchange?

A) Fowler position
B) Prone position
C) Left side-lying position
D) Right Sims position

Answer: A

Explanation: A) The client with hyperaldosteronism with metabolic alkalosis will likely have reduced oxygenation. The Fowler position will facilitate alveolar ventilation with improved oxygenation.

B) The prone position will not facilitate lung expansion.

C) Side-lying positions do not promote lung expansion.

D) Sims or a side-lying position will not promote lung expansion.

Page Ref: 23

Cognitive Level: Understanding

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic alkalosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

9) The nurse notes that a client has a potassium level of 2.8 mEq/L and chloride level of 100 mEq/L. Which action will the nurse take?
A) Prepare to administer 0.9% sodium chloride infusion
B) Measure for nasogastric tube insertion
C) Notify the healthcare provider
D) Review the use of ammonium chloride
Answer: C
Explanation: A) Because the chloride level is within normal limits, an infusion of 0.9% sodium chloride is not indicated.
B) A nasogastric tube is not indicated for this client.
C) Because the client's potassium level is low, the healthcare provider should be notified.
D) There is not enough information to support the use of ammonium chloride for this client, as it is indicated to treat severe metabolic alkalosis.
Page Ref: 21
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Summarize diagnostic tests and therapies used by interdisciplinary teams in the collaborative care of an individual with metabolic alkalosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

10) A client with metabolic alkalosis is at risk for an ineffective breathing pattern. Which data did the nurse use to add this problem to the client's care plan? **Select all that apply.**
A) Respiratory rate 8 per minute
B) Oxygen saturation 89%
C) Urine output 25 mL/hr
D) Restlessness and agitation
E) Weight loss of 3 kg overnight
Answer: A, B, D
Explanation: A) Respiratory compensation for metabolic alkalosis depresses the respiratory rate and reduces the depth of breathing to promote carbon dioxide retention.
B) The depressed respiratory drive associated with metabolic alkalosis can lead to hypoxemia and impaired oxygenation of tissues. Oxygen saturation levels of less than 90% indicate significant oxygenation problems.
C) Urine output less than 30 mL/hr would indicate fluid volume deficit.
D) Changes in mental status or behavior may be early signs of hypoxia.
E) Weight is used as an indicator of fluid balance. A rapid weight change would indicate fluid volume deficit.
Page Ref: 22
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

11) A client is experiencing symptoms of metabolic alkalosis. Which diagnostic test findings support the admitting diagnosis? **Select all that apply.**

A) Serum glucose level 142 mg/dL
B) Blood pH 7.47 and bicarbonate 34 mEq/L
C) Intravenous pyelogram shows kidney stones
D) Bilateral lower lobe infiltrates noted on chest x-ray
E) Electrocardiogram changes consistent with hypokalemia

Answer: B, E

Explanation: A) Serum glucose levels are not associated with metabolic alkalosis.
B) In metabolic alkalosis, the blood pH will be greater than 7.45 and the bicarbonate level greater than 26 mEq/L.
C) Kidney stones are not associated with metabolic alkalosis.
D) Lower lobe infiltrates are not associated with metabolic alkalosis.
E) The ECG pattern shows changes similar to those seen with hypokalemia.

Page Ref: 21

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Summarize diagnostic tests and therapies used by interdisciplinary teams in the collaborative care of an individual with metabolic alkalosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

12) During an assessment, the nurse becomes concerned that a client is at risk for developing metabolic alkalosis. Which finding caused the nurse to have this concern?
A) Daily ingestion of a banana with breakfast
B) Daily weight consistent
C) Daily use of sodium bicarbonate for gastric upset
D) Daily use of prescribed nonsteroidal anti-inflammatory drugs (NSAIDs) for arthritic pain
Answer: C
Explanation: A) Daily ingestion of a banana would prevent the development of hypokalemia from the daily use of sodium bicarbonate.
B) Consistent daily weights would indicate fluid balance.
C) Excess bicarbonate usually occurs as a result of ingesting antacids that contain bicarbonate, such as soda bicarbonate or Alka-Seltzer.
D) Daily use of NSAIDs would not support the development of metabolic alkalosis.
Page Ref: 21
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Compare the risk factors and prevention of metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

13) During a home visit, the nurse evaluates teaching provided to a client recovering from metabolic alkalosis. Which observation indicates that additional teaching is required?
A) Drinks 2 cups of black coffee each day
B) Consumes one orange each day with breakfast
C) Ingests bicarbonate of soda after each meal
D) Monitors and tracks daily weights
Answer: C
Explanation: A) Black coffee is not associated with the development of metabolic alkalosis.
B) Oranges contain potassium, which is beneficial to prevent the development of metabolic alkalosis.
C) The indiscriminate ingestion of sodium bicarbonate is a risk factor for the development of metabolic alkalosis.
D) Tracking of daily weights would help detect a fluid imbalance, which is associated with metabolic alkalosis.
Page Ref: 21
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Compare the risk factors and prevention of metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

14) The nurse is assessing a client with metabolic alkalosis. Which electrolyte imbalance will the nurse associate with the symptoms of this disorder?
A) Hypocalcemia
B) Hypokalemia
C) Hypercalcemia
D) Hyperkalemia
Answer: A
Explanation: A) Manifestations of metabolic alkalosis result from decreased calcium ionization and are similar to those of hypocalcemia. They include numbness and tingling around the mouth, fingers, and toes; dizziness; Trousseau sign; and muscle spasm.
B) Manifestations of metabolic alkalosis are not similar to those of hypokalemia.
C) Manifestations of metabolic are not similar to those of hypercalcemia.
D) Manifestations of metabolic alkalosis are not similar to those of hyperkalemia.
Page Ref: 21
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Identify the clinical manifestations of metabolic alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

15) A newborn with pyloric stenosis has symptoms of projectile vomiting, causing weight loss, dehydration, and metabolic alkalosis. What teaching is necessary for the parents in caring for the infant until surgery to correct the defect?

A) Monitoring for hyperventilation to detect changes in health status

B) Breastfeeding techniques to reverse weight loss and dehydration

C) Positioning of the infant to prevent aspiration

D) Performing percussion and postural drainage to clear the airways

Answer: C

Explanation: A) Hyperventilation leads to respiratory alkalosis and is usually unrelated to pyloric stenosis.

B) Because pyloric stenosis blocks passage of food from the stomach to the small intestines, increasing oral intake will not be beneficial to the infant, so breastfeeding techniques are irrelevant at this time.

C) Complications related to aspiration of vomitus can be prevented by correct positioning of the infant. Parents should be taught correct positioning so they can care for the infant at home or when the nurse is not available.

D) Percussion and postural drainage are more relevant to lung diseases such as cystic fibrosis, not a gastrointestinal (GI) disorder such as pyloric stenosis.

Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 1.B. Analyze metabolic alkalosis as it relates to acid-base balance. Differentiate care of clients with metabolic alkalosis across the lifespan.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

Exemplar 1.C Respiratory Acidosis

1) The nurse is caring for a client recovering from a morphine overdose. Which acid-base imbalance does the nurse expect to observe in this client?
A) Respiratory alkalosis
B) Respiratory acidosis
C) Metabolic alkalosis
D) Metabolic acidosis
Answer: B
Explanation: A) Respiratory alkalosis is caused by many conditions, none of which are related to this client's morphine overdose.
B) Morphine is a narcotic and generally acts to decrease or suppress respirations; therefore, this client is probably hypoventilating. The expected acid-base imbalance would be respiratory acidosis.
C) Metabolic alkalosis is caused by many conditions, none of which are related to this client's morphine overdose.
D) Metabolic acidosisis caused by many conditions, none of which are related to this client's morphine overdose.

Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Describe the pathophysiology of respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

WwW.TbSM.Ng

2) A client is diagnosed with respiratory failure and respiratory acidosis. Which data from the nursing history would the nurse suspect contributed to the client's current state of health?
A) Use of ibuprofen for the control of pain
B) A recent trip to South America
C) Aspiration pneumonia
D) Recent recovery from a cold virus
Answer: C
Explanation: A) Ibuprofen does not pose a threat to the respiratory health of the client.
B) A recent trip to South America would not constitute a respiratory risk factor.
C) Aspiration of a foreign body and acute pneumonia would put the client at risk for respiratory acidosis.
D) Recent recovery from a cold would not likely put the client at risk.
Page Ref: 25
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Compare the risk factors and prevention of respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

3) A school-age client is diagnosed with respiratory acidosis. Which chronic lung illness in the client's health history does the nurse suspect is causing the current diagnosis?
A) Cystic fibrosis
B) Aspiration
C) Hyperthyroidism
D) Pneumonia
Answer: A
Explanation: A) Chronic lung disease such as cystic fibrosis puts the child at risk for respiratory acidosis.
B) Aspiration is an acute lung condition.
C) Hyperthyroidism is a disorder that can cause metabolic acidosis.
D) Pneumonia is an acute lung condition.

Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Describe the etiology of respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

4) A client with chronic obstructive pulmonary disease is diagnosed with respiratory acidosis. For which problem will the nurse plan care?
A) Inadequate gas exchange
B) Ineffective breathing pattern
C) Decreased cardiac output
D) Anxiety
Answer: A
Explanation: A) Inadequate gas exchange is the priority problem for the client with respiratory acidosis. Interventions are aimed at restoring effective alveolar ventilation and gas exchange.
B) There is no evidence that the client has an ineffective breathing pattern.
C) There is no evidence that the client has a change in cardiac output.
D) Although anxiety might occur, there is no evidence that the client is experiencing it.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory acidosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

5) An older adult is recovering from respiratory acidosis caused by restrictive lung disease and pneumonia. Which topics should the nurse include in the discharge teaching for this client?
Select all that apply.
A) Obtain annual influenza immunization
B) Engage in frequent hand washing
C) Avoid crowds
D) Cover the nose and mouth when coughing
E) Restrict fluids
Answer: A, B, C, D
Explanation: A) For the client with a history of chronic lung disease and pneumonia, the nurse should instruct on the importance of receiving annual influenza immunizations.
B) For the client with a history of chronic lung disease and pneumonia, the nurse should instruct on the importance of frequent hand washing.
C) For the client with a history of chronic lung disease and pneumonia, the nurse should instruct on the importance of avoiding crowds.
D) For the client with a history of chronic lung disease and pneumonia, the nurse should instruct on the importance of covering the nose and mouth when coughing.
E) Fluids should be encouraged to ensure that respiratory secretions are thin.
Page Ref: 27-28
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

6) The settings on mechanical ventilation for a client are: respiratory rate, 25 breaths per minute; tidal volume, 600 mL; FiO_2, 30%; humidification 30 mg H_2O/L. After being ventilated for 2 hours, arterial blood gas analysis reveals a pH of 7.20 and a $PaCO_2$ of 49 mmHg. Which change in ventilator settings should the nurse anticipate?
A) Increase in humidification of inspired air
B) Decrease of FiO_2 from 30% to 25%
C) Increased respiratory rate to 30 breaths per minute
D) Decreased tidal volume of each breath
Answer: C
Explanation: A) Humidification has no effect on the amount of CO_2 expelled.
B) Decreasing the FiO_2 would decrease the amount of CO_2 expelled.
C) This client is exhibiting respiratory acidosis that is not corrected by the current ventilator settings. This client needs to "blow off" more CO_2; therefore, the respiratory rate would be increased.
D) Decreasing the tidal volume would decrease the amount of CO_2 expelled.
Page Ref: 26

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise, and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Analysis

Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Summarize diagnostic tests and therapies used by interdisciplinary teams in the collaborative care of an individual with respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

7) A client with acute pneumonia is experiencing severe respiratory acidosis. Which treatments does the nurse anticipate as appropriate for this client? **Select all that apply.**
A) Administer oxygen prn
B) Administer digoxin for heart failure
C) Encourage up to 3 L of fluids per day
D) Place in a prone position
E) Reposition frequently
Answer: A, C, E

Explanation: A) The client with acute pneumonia and respiratory acidosis may require oxygen administration to improve gas exchange.

B) There is not enough evidence to know whether the client is experiencing heart failure as a result of the acute pneumonia.

C) The client with acute pneumonia and respiratory acidosis may increase fluid intake to thin secretions.

D) The client should be placed in the Fowler or semi-Fowler rather than the prone position.

E) The client with acute pneumonia and respiratory acidosis may require frequent repositioning to preventing the pooling of respiratory secretions.

Page Ref: 27

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory acidosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

8) The nurse is caring for a client recently extubated for treatment of aspiration pneumonia and respiratory acidosis. Which action by the nurse provides an optimum environment for this client?
A) Allowing family members to remain with client as much as possible
B) Restraining the client
C) Placing the client in a side-lying position
D) Administering narcotics for pain
Answer: A
Explanation: A) The client with respiratory acidosis often experiences anxiety. This client would benefit from having a family member in the room to provide reassurance.
B) Restraining the client will increase levels of agitation.
C) The client with respiratory failure would benefit most from the semi-Fowler or Fowler position to increase ventilation.
D) Narcotics will depress the respirations and increase respiratory acidosis. A nonnarcotic pain reliever would be considered if this client were experiencing pain.
Page Ref: 27
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.1 Engage with the individual in establishing a caring relationship. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

9) The nurse is reviewing prescriptions written for a client with chronic respiratory acidosis. Which prescription should the nurse question prior to implementation?
A) Keep head of the bed elevated to 40-degree angle.
B) Dextrose 5% and 0.45% normal saline at 100 mL per hour
C) Consult Respiratory Therapy for breathing treatments four times a day
D) Oxygen 6 liters per minute per nasal cannula
Answer: D
Explanation: A) Elevating the head of the bed promotes oxygenation.
B) Adequate hydration such as intravenous fluids is important to promote removal of respiratory secretions.
C) Pulmonary hygiene measures such as breathing treatments may be instituted.
D) In clients with chronic respiratory acidosis, oxygen is administered cautiously to prevent carbon dioxide narcosis.
Page Ref: 27

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

10) A client with pneumonia develops respiratory acidosis. Which medications should the nurse anticipate for this client? **Select all that apply.**
A) The loop diuretic furosemide (Lasix), 20 mg by mouth twice a day
B) The antibiotic amoxicillin, 1 gram intravenous every 6 hours
C) The bronchodilator albuterol, inhaler 2 puffs every 4 hours
D) The anxiolytic diazepam (Valium), 2 mg by mouth at bedtime for sleep
E) Potassium chloride 20 mEq in 100 mL 0.9% normal saline intravenous every day
Answer: B, C
Explanation: A) Diuretics are not used to treat this disorder.
B) Antibiotics such as amoxicillin may be prescribed to treat respiratory infections.
C) Bronchodilator drugs such as an albuterol inhaler may be administered to open the airways.
D) Benzodiazepines such as diazepam are central nervous system depressants and would adversely affect this client's respiratory rate, adversely affecting respiratory acidosis.
E) Potassium chloride is indicated in the treatment of metabolic alkalosis.

Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Summarize diagnostic tests and therapies used by interdisciplinary teams in the collaborative care of an individual with respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

11) A client being treated for an overdose is in acute respiratory acidosis. Which substance found on the toxicology analysis is most likely the cause for the client's current condition?
A) Cocaine
B) Marijuana
C) Oxycodone
D) PCP
Answer: C
Explanation: A) Cocaine is a stimulant.
B) Marijuana does not depress the central nervous system or respiratory center.
C) Oxycodone is an opiate narcotic. Excessive use or overdose of narcotic substances can lead to respiratory depression and respiratory acidosis.
D) PCP is a hallucinogenic agent.

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Describe the etiology of respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

12) The nurse suspects a client with one functioning lung is developing chronic respiratory acidosis. Which manifestation did the nurse assess in this client?
A) Warm, flushed skin
B) Daytime sleepiness
C) Irritability
D) Blurred vision
Answer: B
Explanation: A) The client with acute respiratory acidosis may demonstrate warm, flushed skin.
B) The manifestations of acute and chronic respiratory acidosis differ. The client with chronic respiratory acidosis will demonstrate daytime sleepiness.
C) The client with acute respiratory acidosis may demonstrate irritability.
D) The client with acute respiratory acidosis may demonstrate blurred vision from the acute decline in oxygenation.
Page Ref: 25

Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Identify the clinical manifestations of respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

13) The nurse instructs a client with a history of acute respiratory acidosis and lung infections on ways to prevent further episodes of the health problem. Which client statement indicates that teaching has been effective?
A) "I will limit drinking alcohol to the evening hours only."
B) "I will limit my intake of bananas and oranges."
C) "I will take prescribed antibiotics until my symptoms subside."
D) "I will receive the annual influenza vaccination."
Answer: D
Explanation: A) Alcohol is a central nervous system depressant, which can adversely affect respiratory status and lead to the development of respiratory acidosis.
B) The ingestion of bananas and oranges will not promote the development of respiratory acidosis.
C) The client should be instructed to complete a full course of antibiotics prescribed to treat infections.
D) The nurse should discuss ways to avoid future episodes of acute respiratory infections by encouraging the client to receive immunization against pneumococcal pneumonia and influenza.
Page Ref: 27

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

14) The nurse is planning care for an older client with respiratory acidosis. Which intervention should the nurse include in this client's plan of care?
A) Administer prescribed intravenous fluids carefully.
B) Administer intravenous sodium bicarbonate.
C) Maintain adequate hydration.
D) Reduce environmental stimuli.
Answer: C
Explanation: A) Careful administration of intravenous fluids is important in the older client with metabolic alkalosis because older clients are at risk because of their fragile fluid and electrolyte status.
B) Sodium bicarbonate is indicated in the treatment of metabolic acidosis.
C) In respiratory acidosis, there is a drop in the blood pH, a reduced level of oxygen, and retention of carbon dioxide. The body needs to be well-hydrated so that pulmonary secretions can be removed to improve oxygenation.
D) Reducing environmental stimuli would be appropriate for the client with respiratory alkalosis.
Page Ref: 26
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

15) The nurse is caring for a client with acute respiratory acidosis. Which effect from this disorder can lead to changes in the neurologic and cardiovascular systems?
A) Hypercapnia
B) Carbon dioxide narcosis
C) Hypoventilation
D) Hyperventilation
Answer: A
Explanation: A) In acute respiratory acidosis, increased carbon dioxide levels, also called hypercapnia, can affect neurological function and the cardiovascular system.
B) Carbon dioxide narcosis occurs in chronic respiratory acidosis.
C) Hypoventilation causes respiratory acidosis; it doesn't result from respiratory acidosis.
D) Hyperventilation is related to respiratory alkalosis, not respiratory acidosis.
Page Ref: 24
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Describe the pathophysiology of respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

16) A client with respiratory acidosis is demonstrating signs of neurologic changes. In which way will hypercapnia affect this client?
A) Decrease pulse rate
B) Cause hyperventilation
C) Cause cerebral vasodilation
D) Lead to neurotransmitter disturbances
Answer: C
Explanation: A) The pulse rate is elevated in acute respiratory acidosis, not decreased.
B) Respiratory acidosis is caused by hypoventilation, not hyperventilation.
C) Hypercapnia causes cerebral vasodilation, which results in headache, blurred vision, irritability, mental cloudiness, and decreased level of consciousness.
D) Neurotransmitter disturbances are unrelated to respiratory acidosis.
Page Ref: 25
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.C. Analyze respiratory acidosis as it relates to acid-base balance. Identify the clinical manifestations of respiratory acidosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with respiratory acidosis.

Exemplar 1.D Respiratory Alkalosis

1) A client in severe pain is diagnosed with respiratory alkalosis. Which arterial blood gas value does the nurse document to support this diagnosis?

A) pH is 7.33 and $PaCO_2$ is 36.
B) pH is 7.51 and HCO_3 is 30.
C) pH is 7.47 and $PaCO_2$ is 25.
D) pH is 7.35 and PaO_2 is 88.
Answer: C
Explanation: A) The pH would denote alkalosis and would be higher than 7.45.
B) HCO_3 would trend downward as the kidneys begin to compensate for the alkalosis by excreting HCO_3.
C) Acute pain usually causes hyperventilation, which causes the $PaCO_2$ to drop and the client to experience respiratory alkalosis. The pH would denote alkalosis and would be higher than 7.45.
D) The pH would denote alkalosis and would be higher than 7.45.
Page Ref: 29
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Describe the pathophysiology of respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

2) The client seeks medical attention for symptoms of a panic attack, including hyperventilation. For which health problem will the nurse plan care for the client?
A) Hypoventilation
B) Vomiting
C) Respiratory alkalosis
D) Memory loss
Answer: C
Explanation: A) Anxiety and panic attacks will lead to hyperventilation, not hypoventilation.
B) The client with anxiety does not necessarily have vomiting as a risk factor.
C) Anxiety disorders increase the risk for the acid-base imbalance respiratory alkalosis, due to hyperventilation that accompanies anxiety and panic attacks.
D) The client with anxiety does not necessarily have memory loss.
Page Ref: 29
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 1.C. Analyze respiratory alkalosis as it relates to acid-base balance. Describe the etiology of respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

3) The nurse is caring for an older adult who is hyperventilating. Which statement will the nurse make when helping the client slow the breathing?
A) "What are you afraid of?"
B) "Slow down your breathing."
C) "Why are you breathing so fast?"
D) "Watch me and we can breathe together."
Answer: D
Explanation: A) Statements should be used instead of asking direct questions.
B) Telling the client to slow breathing without demonstrating it will not be effective.
C) The client may not know why the breathing is rapid.
D) Clients who are hyperventilating will be frightened and anxious. Helping them to slow down their breathing will help to resolve respiratory alkalosis. Use a calm voice and exhibit an even demeanor. Reassure clients that helping them to breathe more slowly will make them feel better. Since communication may be difficult, use statements such as "watch me and we can breathe together."
Page Ref: 30
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.8 Promote self-care management | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

4) A client is diagnosed with a salicylate overdose. Which problem will the nurse prioritize for this client?
A) Ineffective breathing pattern
B) Powerlessness
C) Potential for injury
D) Impaired mobility
Answer: A
Explanation: A) The client with a salicylate overdose is at risk for hyperventilation, which can lead to respiratory alkalosis.
B) There is not enough evidence to determine if powerlessness is a priority for this client.
C) Potential for injury might be an issue if breathing is not addressed.
D) There is not enough information to know whether the client's mobility is impaired.
Page Ref: 31
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

5) A client with an anxiety disorder is being discharged. Which teaching will the nurse prepare for this client? **Select all that apply.**

A) Refer the client for counseling
B) Instruct the client to eat foods high in acid
C) Teach the client the signs of impending panic attack
D) Advise the client to breathe into a paper bag when feeling anxious
E) Instruct the client to breathe slowly

Answer: A, C, E

Explanation: A) The client with an anxiety disorder should be referred to counseling to assist with management of the disorder.
B) Eating foods high in acid will not counteract the results of hyperventilation.
C) The client with an anxiety disorder should be taught signs of an impending panic attack.
D) The use of paper bags has been a recommended treatment for hyperventilation; however, it can also cause hypoxia.
E) Teaching the client to breathe slowly helps the client manage hyperventilation at home.

Page Ref: 30
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.8 Promote self-care management. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

6) The nurse instructs a client with an anxiety disorder. Which client statement indicates that client teaching about respiratory alkalosis has been effective?
A) "I will see my counselor on a regular basis."
B) "I will breathe faster when I am feeling anxious."
C) "I will eat more bananas at breakfast."
D) "I will not take antacids when I have heartburn."
Answer: A
Explanation: A) The client understands that reducing anxiety can reduce hyperventilation and respiratory alkalosis. Seeing a counselor can help the client develop alternative strategies for dealing with anxiety.
B) Breathing faster will increase hyperventilation.
C) Eating bananas is more appropriate for the client at risk for metabolic alkalosis who is on diuretics.
D) Taking too many antacids is associated with metabolic alkalosis.
Page Ref: 31
Cognitive Level: Analyzing
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

7) A client is diagnosed with respiratory alkalosis. Which prescriptions would be appropriate for this client's care needs? **Select all that apply.**
A) Oxygen 2 liters via face mask
B) Restrict fluids to 2 liters per day
C) Admit to a private room
D) Infuse 1 ampule of sodium bicarbonate now
E) Draw arterial blood gases
Answer: C, E
Explanation: A) The client has respiratory alkalosis, which is caused by hyperventilation. Additional oxygen is not required.
B) A fluid restriction is not required in the treatment of respiratory alkalosis.
C) It is important to create a calm, quiet, low-stimulation environment to reduce the client's anxiety or panic.
D) Sodium bicarbonate is used in the treatment of respiratory and metabolic acidosis.
E) Arterial blood gases must be ordered prior to beginning medication or oxygen therapy.
Page Ref: 29
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Summarize diagnostic tests and therapies used by interdisciplinary teams in the collaborative care of an individual with respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

8) A client with a history of anxiety is experiencing chest pain, palpitations, and dyspnea. Which intervention would be a priority for this client?
A) Providing educational material for the client's medical diagnosis
B) Ordering a regular diet for the client
C) Reassuring the client that symptoms will resolve
D) Asking Respiratory Therapy to set up a mechanical ventilator
Answer: C
Explanation: A) Providing teaching for the client becomes a priority when the client is recovering from the illness.
B) Ordering the diet is done by the healthcare provider.
C) The client will require reassurance from the nurse that the symptoms being experienced are not those of a heart attack and that the symptoms will resolve when the breathing pattern returns to normal.
D) Instructing the respiratory therapist is done by the healthcare provider.
Page Ref: 31
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

9) A client with metabolic alkalosis is experiencing numbness around the mouth and tingling of the fingers. Which information will the nurse provide as the reason for these manifestations?

A) "Because you are breathing so fast, the oxygen is not getting to your nerve endings."

B) "Your health problem affects calcium in your body, which causes the tingling around your mouth and fingers."

C) "You have a buildup of carbon dioxide in your blood."

D) "You don't have enough potassium in your body, so the tingling around your mouth and fingers will occur."

Answer: B

Explanation: A) Rapid breathing is not reducing the amount of oxygen reaching the nerve endings.

B) Alkalosis increases binding of extracellular calcium to albumin, reducing ionized calcium levels. As a result, neuromuscular excitability increases, and manifestations similar to hypocalcemia develop. These manifestations include circumoral and distal extremity paresthesias.

C) Excessive carbon dioxide would lead to acidosis.

D) Respiratory alkalosis is not caused by an imbalance of serum potassium.

Page Ref: 29

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Identify the clinical manifestations of respiratory alkalosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

10) A client who is intubated is fighting the ventilator and attempting to pull out the endotracheal tube. Which action will the nurse take to reduce this client's risk of developing respiratory alkalosis?
A) Administer a sedative as prescribed
B) Apply wrist restraints
C) Teach the client to take slow, deep breaths
D) Discuss removing the endotracheal tube with the healthcare provider
Answer: A
Explanation: A) For a client being mechanically ventilated, the only way to reduce rapid respirations might be to provide a sedative.
B) Applying wrist restraints to a client who is demonstrating anxiety with an endotracheal tube might increase the client's anxiety.
C) The client is being mechanically ventilated, which means there is a problem with maintaining the airway. The client will not be able to take slow, deep breaths at this time.
D) The reason for the endotracheal tube is to maintain the client's airway. Removing the tube could lead to a collapse of the airway and a life-threatening situation.
Page Ref: 29
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Summarize diagnostic tests and therapies used by interdisciplinary teams in the collaborative care of an individual with respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

11) The nurse is evaluating care provided to a client with respiratory alkalosis. Which outcomes indicate that nursing care has been effective for this client? **Select all that apply.**

A) Respiratory rate 18 and regular

B) Sleeping through the night

C) Gait steady

D) Consistent body weight

E) Using prescribed bronchodilators

Answer: A, B, C, D

Explanation: A) Appropriate outcomes for the care of a client with respiratory alkalosis include normal respiratory rate and rhythm.

B) Ability to sleep through the night would indicate a reduction in anxiety, which is a risk factor for the development of respiratory alkalosis.

C) Appropriate outcomes for the care of a client with respiratory alkalosis include no episodes of injuries.

D) Appropriate outcomes for the care of a client with respiratory alkalosis include maintenance of fluid balance.

E) Bronchodilators are not used to treat this acid-base imbalance.

Page Ref: 31

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory alkalosis.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

12) A client is brought to the emergency department (ED) with rapid breathing after learning of a family member being killed in a house fire. Which action will the nurse complete first to help this client?
A) Coach to slow the breathing
B) Move to a quiet, calm environment
C) Provide a sedative
D) Ask for a psychiatric consultation
Answer: B
Explanation: A) Once the environment is controlled, the nurse can begin to implement interventions to help the client slow the breathing rate.
B) Nursing care is focused on reducing anxiety through manipulation of the environment to reduce stimuli and to create a sense of peace. This restful environment will help the client breathe more slowly and effectively.
C) A sedative may be prescribed; however, this would not be the first intervention.
D) A psychiatric consult might be indicated for someone with a history of anxiety or panic attacks that lead to the development of respiratory alkalosis. Because this client has had a shock, a psychiatric consultation would not be indicated at this time.
Page Ref: 31
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

13) A client begins to hyperventilate after learning that a breast biopsy was positive for cancer. After a few minutes, the client loses consciousness. Which action by the nurse is the priority?
A) Begin cardiopulmonary resuscitation
B) Raise the side rails on the bed
C) Notify the physician
D) Insert an intravenous access device
Answer: B
Explanation: A) The client does not need cardiopulmonary resuscitation.
B) The nurse should protect the client from injury. If hyperventilation continues to the point where the client loses consciousness, respirations will return to normal, as will acid-base balance.
C) The physician may need to be notified; however, the client's safety is a priority.
D) The client is not critically ill, and an intravenous access device is not indicated at this time.
Page Ref: 31
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Apply the nursing process in providing culturally competent care to an individual with respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

14) The nurse is preparing a teaching tool about respiratory alkalosis. Which disorder will the nurse identify that increases the risk for this acid-base imbalance?
A) A respiratory disorder
B) An anxiety disorder
C) A cardiovascular disorder
D) A congenital disorder
Answer: B
Explanation: A) Respiratory disorders are more likely to lead to respiratory acidosis.
B) Anxiety with hyperventilation is the most common cause of respiratory alkalosis. Therefore, anxiety disorders increase the risk for respiratory alkalosis.
C) Cardiovascular disorders do not usually lead to respiratory alkalosis.
D) Congenital disorders do not usually lead to respiratory alkalosis.
Page Ref: 29
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Compare the risk factors and prevention of respiratory alkalosis.
MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

15) A 2-month-old infant with pneumonia with respiratory alkalosis is believed to be experiencing paresthesias of the hands and feet, because the infant pulls away and cries when the extremities are touched. Which teaching will the nurse provide the parents to address the paresthesias?
A) Postural drainage techniques
B) Massage techniques
C) Breastfeeding techniques
D) Swaddling techniques
Answer: D
Explanation: A) Postural drainage techniques are used to clear the airway, not comfort the infant.
B) Massage techniques will likely cause additional discomfort for the infant; calming touch is needed instead.
C) A mother of a 2-month-old infant likely already understands breastfeeding techniques.
D) Comfort measures that may be successful for infants experiencing paresthesias include swaddling, calming touch, and speaking with a quiet voice.
Page Ref: 30
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.8 Promote self-care management. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 1.D. Analyze respiratory alkalosis as it relates to acid-base balance. Differentiate care of clients with respiratory alkalosis across the lifespan.

MNL LO: Demonstrate understanding of the concept of acid-base balance in the care of a patient with metabolic alkalosis.

Module 2 Cellular Regulation

The Concept of Cellular Regulation

1) The nurse is teaching a class to prospective parents about the role that deoxyribonucleic acid (DNA) plays in the development of the human fetus. Which statement made by the parents indicates understanding of the teaching?
A) "DNA molecules are made up of genes."
B) "DNA is used to form ribosomes."
C) "DNA is outside the nucleus of the cell."
D) "DNA is attached to the endoplasmic reticulum."
Answer: A
Explanation: A) DNA contains all the instructions, or genes, needed to determine an individual's inherited characteristics and produce every protein needed by the body.
B) RNA, not DNA, is used to form ribosomes.
C) DNA is located within the nucleus of the cell.
D) Ribosomes are found on the endoplasmic reticulum.
Page Ref: 34
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 2.1. Analyze the physiology of cellular regulation in the body.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

2) The nurse is reviewing the different cellular alterations. Which statement will the nurse make when asked to described hyperplasia?
A) "It is abnormal grown of specific tissue."
B) "It is a cell returning to an immature state."
C) "It is the replacement of one cell by another cell type."
D) "It is an increase in the number or density of normal cells."
Answer: D
Explanation: A) Dysplasia is characterized by disturbed cell growth of specific tissue.
B) Anaplasia is the regression of a cell to an immature or undifferentiated cell type.
C) Metaplasia is a reversible change in which one adult cell type is replaced by another adult cell type.
D) Hyperplasia is an increase in the number or density of normal cells.
Page Ref: 36
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.2. Differentiate alterations in cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

3) The nurse is preparing to perform a health assessment on an adult client who has a family history of cancer. Which question should the nurse ask to assess for the early warning signs of cancer? **Select all that apply.**
A) "Do you have a cough that is associated with seasonal allergies?"
B) "Have you noticed a change in your appetite?"
C) "Have you noticed any cuts that have not healed?"
D) "Have you had any changes in bowel or bladder habits?"
E) "Have you experienced any problems swallowing?"
Answer: C, D, E
Explanation: A) A cough that is associated with seasonal allergies is not associated with the early warning signs of cancer.
B) Changes in appetite are not associated with the early warning signs of cancer.
C) The early warning signs of cancer include a sore that does not heal.
D) The early warning signs of cancer include a change in bowel or bladder habits.
E) The early warning signs of cancer include difficulty swallowing.
Page Ref: 40
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Assessment

Learning Outcome: 2.5. Differentiate common assessment procedures and tests used to examine cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

4) The nurse is caring for a client diagnosed with cancer. Which diagnostic tests may be helpful to assist with treatment options? **Select all that apply.**
A) Tumor markers
B) Urinalysis
C) Physical assessment
D) MRI
E) Stool analysis
Answer: A, B, D
Explanation: A) Many diagnostic tests are helpful in determining treatment for cancer. Tumor markers are all diagnostic tests that may be used to determine treatment for cancer.
B) Many diagnostic tests are helpful in determining treatment for cancer. Urinalysis may be used to determine treatment for cancer.
C) A physical assessment may be useful to determine how a client is responding to treatment, but it is not considered a diagnostic test.
D) Many diagnostic tests are helpful in determining treatment for cancer. An MRI may be used to determine treatment for cancer.
E) A stool analysis is not a diagnostic test listed to determine treatment for cancer.
Page Ref: 40-41
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 2.5. Differentiate common assessment procedures and tests used to examine cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

5) The nurse instructs a group of community members about ways to reduce the development of cancer. Which participant statements indicate that teaching has been effective? **Select all that apply.**

A) "I should eat at least two servings of fruits or vegetables each day."
B) "Sunscreen should be applied before spending time outdoors."
C) "I need to cut down on my smoking."
D) "I need to get my home tested for radon."
E) "I need to minimize my child's exposure to secondhand smoke."

Answer: B, D, E

Explanation: A) Efforts to reduce the development of cancer include eating five servings of fruits and vegetables each day.
B) Sunscreen should be used by those who spend time outside regularly for work or recreation.
C) All smoking should be discouraged.
D) The home should be tested for radon, which is a known cancer-causing substance.
E) Children should be protected from exposure to tobacco smoke.

Page Ref: 40
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 2.4. Explain the promotion of healthy cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

6) The nurse is caring for a client with leukemia. Which treatment should the nurse expect to be prescribed for this client?
A) Diuretic therapy
B) Chemotherapy
C) Electrolyte replacement therapy
D) IV fluid therapy
Answer: B
Explanation: A) Diuretics are not typically used to treat cancer, although they may be used if complications develop.
B) The client with an alteration in cell growth has cancer and will most likely be treated with chemotherapy.
C) Electrolyte replacement is not typically used to treat cancer, although it may be used if complications develop.
D) IV fluids are not typically used to treat cancer, although they may be used if complications develop.
Page Ref: 43
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.6. Describe how the strength and relevance of available evidence influences the choice of interventions in provision of patient-centered care. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 2.7. Summarize collaborative therapies used by interprofessional teams for patients with alterations in cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

7) The nurse is caring for an adolescent client with a strong family history of breast cancer. Which information should the nurse include when instructing the client regarding cancer prevention? **Select all that apply.**
A) Encourage the client to learn more about the disease.
B) Talk to family members who have the disease.
C) Perform monthly breast self-examination.
D) Teach the side effects of cancer treatment.
E) Discuss cancer fears with the healthcare provider.
Answer: A, C
Explanation: A) When there is a familial history of cancer, the client should be encouraged to learn more about the cancer.
B) Talking to family members who have the disease will not help with early detection or prevention.
C) In families with a history of breast cancer, the nurse should inform clients about breast self-examination.
D) Teaching the side effects of cancer treatment would be appropriate if the client was diagnosed with breast cancer.
E) The client can discuss cancer fears with the nurse; however, this action will not help prevent the development of the disease.
Page Ref: 39-40
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 2.4. Explain the promotion of healthy cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

8) A client with anemia is prescribed synthetic erythropoietin. When teaching the client about the therapeutic effect of this treatment, which is appropriate for the nurse to include?
A) Increase in platelets
B) Increase in red blood cells
C) Decrease in white blood cells
D) Decrease in lymph fluid
Answer: B
Explanation: A) Erythropoietin will not stimulate the production of platelets.
B) Erythropoietin is a hormone produced in the body to stimulate production of red blood cells.
C) Erythropoietin will not decrease the production of white blood cells.
D) Erythropoietin will not decrease the production of lymph fluid.
Page Ref: 37
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 2.7. Summarize collaborative therapies used by interprofessional teams for patients with alterations in cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

9) The nurse is reviewing the concepts of human growth and development with a group of clients. Which statement indicates that teaching has been effective?
A) "The zygote undergoes differentiation to form a multicellular embryo, which becomes a fetus and then an infant."
B) "Meiosis occurs only in the sex cells of the testes and ovaries."
C) "Mitosis reduces the amount of genetic material by half."
D) "When the two sex cells combine during fertilization, a total of 50 chromosomes are present in the offspring's cells."
Answer: B
Explanation: A) The zygote undergoes mitosis to form a multicellular embryo, which becomes a fetus and then an infant.
B) Meiosis, which reduces the amount of genetic material by half, occurs only in the sex cells of the testes and ovaries.
C) Mitosis results in two cells, called daughter cells, that are genetically identical to the original cell and to each other.
D) When the two sex cells combine during fertilization, the total number of chromosomes present in the offspring's cells is 46, not 50.
Page Ref: 35-36
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 2.1. Analyze the physiology of cellular regulation in the body.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

10) The nurse is creating a teaching tool about methods of cellular transport. Which information about passive transportation will the nurse include in the tool?
A) Endocytosis
B) Facilitated diffusion
C) Exocytosis
D) Phagocytosis
Answer: B
Explanation: A) Active cellular transportation requires energy and includes endocytosis.
B) Passive cellular transportation does not require energy and includes facilitated diffusion.
C) Active cellular transportation requires energy and includes exocytosis.
D) Active cellular transportation requires energy and includes phagocytosis.

Learning Outcome: 2.1. Analyze the physiology of cellular regulation in the body.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

11) The nurse is caring for a client with cancer. Which cellular alterations in the cell cycle should the nurse include when teaching the client? **Select all that apply.**

A) Hyperplasia
B) Differentiation
C) Anaplasia
D) Dysphagia
E) Adaptation
Answer: A, C
Explanation: A) Hyperplasia is an increase in the number or density of normal cells, while anaplasia is the regression of a cell to an immature or undifferentiated cell type.
B) Differentiation is a normal process occurring over many cell cycles that allows cells to specialize in certain tasks.
C) Anaplasia is the regression of a cell to an immature or undifferentiated cell type.
D) Dysphagia is not a part of the cell cycle.
E) Adaptation is not a part of the cell cycle.
Page Ref: 36
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 2.2. Differentiate alterations in cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

12) The nurse is caring for a client with sickle cell anemia. Which type of hemoglobin causes the abnormal shape to the red blood cell?
A) Hgb A
B) Hgb S
C) Hgb B
D) Hgb E
Answer: B
Explanation: A) The abnormal sickle-shaped red blood cell in sickle cell anemia is not caused by an abnormal shape in Hgb A.
B) The inherited alteration of Hgb S causes the abnormal sickle-shaped red blood cell in sickle cell anemia.
C) The abnormal sickle-shaped red blood cell in sickle cell anemia is not caused by an abnormal shape in Hgb B.
D) The abnormal sickle-shaped red blood cell in sickle cell anemia is not caused by an abnormal shape in Hgb E.
Page Ref: 37
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.2. Differentiate alterations in cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

13) The nurse is planning care for a client with cancer. Which independent nursing intervention should the nurse include in the plan of care?
A) Administer pain and other medications
B) Help the client identify support systems
C) Design a diet that provides proper nutrition
D) Suggest contacting the nurse's spiritual leader
Answer: B
Explanation: A) Administering medications is a collaborative intervention.
B) Clients who are diagnosed with an alteration in cellular regulation will experience many different emotions, and they will need a proper support system to help them cope with the diagnosis and provide care when needed. The nurse can help the client identify a support system of friends, family, and support groups.
C) Nurses should refer clients to a dietitian for a diet plan.
D) The nurse should facilitate contact with the client's spiritual leader if desired, not the nurse's spiritual leader.
Page Ref: 41-42
Cognitive Level: Remembering
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 2.6. Analyze independent interventions nurses can implement for patients with alterations in cellular regulation.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

14) The parents of a toddler being treated for sickle cell crisis are concerned because the child is wetting the bed despite being potty trained. Which statement should the nurse make to the parents?
A) "Your child is likely rebelling because of the treatments and needs discipline."
B) "Bedwetting is often a sign of urinary tract infection. I will have the provider check for that."
C) "Toddlers often regress in behaviors when they are sick. "
D) "Nocturnal enuresis is a side effect of the medications."
Answer: C
Explanation: A) Bedwetting is not usually a sign of rebellion.
B) Bedwetting may be a sign of a urinary tract infection but without additional signs or symptoms, this is less likely to be true.
C) A toddler who has been potty trained will often regress in behaviors and begin wetting the bed when faced with a stressful illness. It is important for the parents to understand that this is common and that the child will likely return to previous behaviors once the health crisis is past.
D) Bedwetting may be a side effect of medications, but without additional signs or symptoms, it is less likely to be true.

Learning Outcome: 2.8. Differentiate considerations related to the care of patients with alterations in cellular regulation throughout the lifespan.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

15) The nurse is caring for a pregnant client with a cellular regulation disorder. About which potential complication should the nurse include when teaching the client?
A) Gestational diabetes
B) Placenta previa
C) Urinary tract infection
D) Preeclampsia
Answer: D
Explanation: A) Gestational diabetes is not specifically related to cellular regulation disorders.
B) Placenta previa is not specifically related to cellular regulation disorders.
C) Urinary tract infection is not a serious complication.
D) A pregnant client with a cellular regulation disorder is at higher risk for preeclampsia during pregnancy.
Page Ref: 45
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Implementation
Learning Outcome: 2.8. Differentiate considerations related to the care of patients with alterations in cellular regulation throughout the lifespan.
MNL LO: Analyze the concept of cellular regulation and its application to nursing care.

Exemplar 2.A Cancer

1) A client with cancer is scheduled for chemotherapy before and after surgery. For which reason is chemotherapy scheduled at these times? **Select all that apply.**
A) Eradicate all cancer cells
B) Shrink the tumor
C) Kill remaining cancer cells
D) Allow the immune system to kill cancer cells
E) Improve wound healing
Answer: B, C
Explanation: A) It is impossible to eradicate all cancer cells with chemotherapy.
B) Chemotherapy before surgery is used to shrink the tumor.
C) Chemotherapy is used after surgery to kill remaining cancer cells.
D) The use of chemotherapy before and after surgery will not allow the immune system to kill the cancer cells.
E) Chemotherapy is not used to improve wound healing.
Page Ref: 61-62
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

WwW.TeSm.Ws

2) The nurse instructs a group of community members on ways to reduce the risk of cancer. Which statements indicate that teaching has been effective? **Select all that apply.**
A) "I started using sunscreen when I work outside."
B) "I began drinking two glasses of red wine a day with dinner."
C) "I have reduced my intake of fiber."
D) "I have increased the amount of fried fish in my diet."
E) "I am trying to quit smoking."
Answer: A, E
Explanation: A) Sun exposure increases the risk of skin cancer, so using sunscreen when outdoors would indicate understanding.
B) Drinking two glasses of red wine daily is not an action that reduces cancer risk.
C) Increased fiber intake reduces the risk of colon cancer.
D) Increasing the amount of fried fish is not an action that reduces cancer risk.
E) Smoking increases the risk of lung and other types of cancer, so trying to quit smoking would indicate understanding.
Page Ref: 51
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Compare the risk factors , and prevention of, cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

3) The nurse is preparing a seminar that discusses the risk and incidence of cancer and culture. Which information is considered culturally correct when teaching about the risk of developing cancer?

A) Black males and white females are more likely to develop cancer than any other ethnic group.

B) Native Americans have the highest incidence of prostate cancer.

C) The incidence and mortality rate of all types of cancers are lowest in the Caucasian population.

D) The Hispanic population has the lowest mortality rate of any racial or ethnic group.

Answer: A

Explanation: A) Black males and white females more likely to develop cancer than any other ethnic group in the US.

B) Native Americans and Asians have the lowest incidence of prostate cancer.

C) Cancer incidence and mortality are lower in Native American men and women than in any other ethnic or racial group.

D) Mortality rates are lowest among the Asian/Pacific Islander population.

Page Ref: 47

Cognitive Level: Applying

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

4) A preschool-age child has an appointment in a pediatric oncology clinic. Which reactions are considered common for the preschool-age child to experience with illnesses and hospitalizations? **Select all that apply.**
A) Unawareness of the illness and its severity
B) Understanding of what cancer is and how it is treated
C) Thoughts that they caused their illness and are being punished
D) Confusion as to why a parent is unable to make the illness go away
E) Acceptance, especially if able to discuss the disease with children their own age
Answer: C, D
Explanation: A) Infants and toddlers are unaware of the severity of the disease.
B) School-age children can understand a diagnosis of cancer.
C) Preschoolers are beginning to understand illness. However, they may think they caused their illness.
D) Preschoolers are beginning to understand illness. However, they may be confused about why the parent cannot make the illness go away.
E) Immediate acceptance will not occur with children of any age. Adolescents find contact with others who have gone through their experience helpful.
Page Ref: 65
Cognitive Level: Analyzing
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.1 Engage with the individual in establishing a caring relationship. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Differentiate considerations for care of patients with cancer across the lifespan.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

5) A client being treated for cancer has a tumor designation of Stage IV, T4, N3, M1. Which information does this staging provide to the nurse?
A) The tumor will respond to chemotherapy.
B) The tumor is small in size.
C) The tumor has metastasized with lymph node involvement.
D) There is one single tumor to treat.
Answer: C
Explanation: A) The staging system is not used to determine tumor response to chemotherapy.
B) The numbers range from 0 to 4, with higher numbers indicating increased size and metastasis.
C) T refers to the depth of invasion. N refers to the absence or presence and extent of lymph node involvement. M refers to presence of metastasis.
D) Stage IV indicates metastasis.
Page Ref: 57
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

6) The nurse is providing discharge instructions to a client being treated for cancer. For which symptoms should the client be instructed to call for help at home? **Select all that apply.**

A) Difficulty breathing
B) Significant increase in vomiting
C) Desire to end life
D) Improved sense of well-being
E) New onset of bleeding

Answer: A, B, C, E

Explanation: A) The client should be instructed to call for help with any difficulty breathing.
B) The client should be instructed to call for help with any significant increase in vomiting.
C) The client should be instructed to call for help with a desire to end life.
D) An increased sense of well-being would be a desired effect of treatment for cancer.
E) The client should be instructed to call for help with a new onset of bleeding.

Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

7) The nurse instructs a group of community members on the difference between benign and malignant neoplasms. Which participant statements indicate that teaching has been effective? **Select all that apply.**

A) "Benign tumors grow slowly."
B) "Malignant tumors are easy to remove."
C) "Benign tumors stay in one area."
D) "Malignant tumors crowd out surrounding tissue."
E) "Malignant tumors can grow back."

Answer: A, C, E

Explanation: A) Benign tumors are slow-growing.
B) Malignant tumors are more difficult to remove.
C) Benign tumors stay in one area.
D) Malignant tumors invade neighboring tissue.
E) Malignant tumors can return once removed.

Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Describe the pathophysiology of cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

8) A client with cancer is receiving chemotherapy and has lost 10 lbs. over the past week. Which instruction should the nurse give to this client to improve nutritional status? **Select all that apply.**

A) Purchase fast foods and prepared foods.
B) Eat cold foods rather than hot foods.
C) Keep a food diary and record intake.
D) Eat large frequent meals high in calories.
E) Drink liquid supplements to increase intake of nutrients.

Answer: B, C, E

Explanation: A) Fast foods and prepared foods tend to be high in fat and sodium and are not the best choice because they do not contain adequate healthy nutrients.
B) The client receiving chemotherapy may tolerate cold foods better than hot foods.
C) The goal of nutritional teaching is to help the client increase caloric and nutrient intake through the use of a food diary that will help the nurse evaluate strengths and weaknesses of the current plan.
D) The client will unlikely tolerate large frequent meals that are high in calories.
E) The goal of nutritional teaching is to help the client increase caloric and nutrient intake through the use of liquid supplements.

Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

9) The nurse is reviewing the process of carcinogenesis. Which change occurs during the initiation stage?

A) DNA changes are passed on to more cells during cell replication.

B) A carcinogen causes permanent damage to DNA.

C) A carcinogen acts repeatedly on cells with damaged DNA.

D) A gene is activated that promotes cell proliferation.

Answer: C

Explanation: A) The progression stage involves inherited changes that are acquired during cell replication developing into a cancer.

B) The promotion stage involves conditions such as smoking or alcohol use that act repeatedly on the already affected cells.

C) The initiation stage involves permanent damage in the cellular DNA as a result of exposure to a carcinogen.

D) Oncogenes are genes that promote cell proliferation; they are not part of the carcinogenic process.

Cognitive Level: Remembering

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Describe the etiology of cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

10) The nurse is caring for a client with cancer. Which assessment will the nurse make to monitor for the development of cachexia?
A) Weight
B) Blood pressure
C) Heart rate
D) Temperature
Answer: A
Explanation: A) Cachexia is a wasting syndrome associated with cancer that includes malnutrition and unexplained loss of weight and muscle mass. Monitoring weight is the assessment to determine if cachexia is developing.
B) Cachexia is unrelated to blood pressure.
C) Cachexia is unrelated to heart rate.
D) Cachexia is unrelated to body temperature.

Learning Outcome: 2.A. Analyze cancer as it relates to cellular regulation. Identify the clinical manifestations of cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with cancer.

Exemplar 2.B Anemia

1) A client who had gastric bypass surgery one year ago has a beefy, red, and smooth tongue and a yellow cast to the skin. Which additional information is needed before diagnosing this client?
A) Folic acid level
B) Vitamin B_{12} levels
C) Potassium levels
D) Iron levels
Answer: B
Explanation: A) Jaundice is not associated with folic acid deficiency anemia.
B) Vitamin B_{12} deficiency is associated with resection of the stomach or ileum. A deficiency of vitamin B_{12} will result in pernicious anemia. This deficiency will manifest as pallor, jaundice, weakness, and a beefy, smooth, red tongue.
C) The client's reports are not consistent with a potassium deficiency.
D) Iron deficiency anemia will manifest with weakness and fatigue.
Page Ref: 79

Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Identify the clinical manifestations of anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

WWW.IBSM.WS

2) A client experiencing fatigue, pallor, and dyspnea on exertion has a complete blood count drawn. Which red blood cell disorder should the nurse anticipate the client is experiencing?
A) Polycythemia
B) Erythropoiesis
C) Herpes simplex
D) Anemia
Answer: D
Explanation: A) Polycythemia is an abnormally high RBC count.
B) Erythropoiesis is the term for RBC production.
C) Herpes simplex is not a red blood cell disorder.
D) Anemia is a common red blood cell disorder, involving a low RBC count and decreased hemoglobin content. Signs and symptoms of anemia can include pallor of the skin and mucous membranes and dyspnea on exertion.
Page Ref: 75
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Identify the clinical manifestations of anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

3) A client with a history of anemia has started a vegan diet. Which addition to meals should the nurse recommend to help ensure that this client has adequate amounts of iron in the diet? **Select all that apply.**

A) Legumes
B) Orange juice
C) Yeast
D) Okra
E) Peas

Answer: A, B, E

Explanation: A) While all these options are good ones for someone on a vegan diet, the ones that would best prevent iron deficiency are legumes, peas, and orange juice. Legumes are good sources of nonheme iron.

B) Orange juice supports iron absorption from foods since it is high in vitamin C.

C) Yeast is a good source of folic acid.

D) Okra is not a good source of iron.

E) While all these options are good ones for someone on a vegan diet, the ones that would best prevent iron deficiency are legumes, peas, and orange juice. Peas are good sources of nonheme iron.

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with anemia.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

4) An older adult client with renal failure is diagnosed with anemia. For which cause of anemia will the nurse plan care for this client?
A) Loss of the kidney hormone erythropoietin
B) A loss of appetite related to elevated blood urea nitrogen (BUN) and creatinine levels
C) The renal dialysis used to treat the chronic renal failure
D) Loss of blood through the urine because the failing kidney does not function properly
Answer: A
Explanation: A) The anemia associated with renal failure is related to the loss of erythropoietin, which is produced by the healthy kidney and stimulates bone marrow to produce red blood cells.
B) The anemia is not directly related to anorexia changes in laboratory values.
C) The anemia is not directly related to hemodialysis.
D) Renal failure causes the loss of protein, not blood, through the urine.

Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Describe the etiology of anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

5) A nursing student is preparing an educational program on acquired hemolytic anemia for the residents of an assisted living center. Which causes of acquired hemolytic anemia should the student include in the program? **Select all that apply.**

A) Bacterial infection
B) Thalassemia
C) Blood transfusion reaction
D) Prosthetic heart valves
E) Acetaminophen use

Answer: A, C, D

Explanation: A) Bacterial infections are acquired hemolytic anemia.
B) Thalassemia is considered an intrinsic cause of hemolytic anemia and would not be appropriate to include in this particular teaching.
C) Blood transfusion reactions are causes of acquired hemolytic anemia.
D) Prosthetic heart valves are causes of acquired hemolytic anemia.
E) Acetaminophen use is not associated with hemolytic anemia.

Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Describe the etiology of anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

6) A client with severe anemia experiences shortness of breath when walking short distances. Which problem will the nurse make a priority for this client's care?

A) Self-neglect
B) Inability to tolerate activity
C) Inadequate gas exchange
D) Acute pain

Answer: B

Explanation: A) There is no evidence that the client is experiencing self-neglect.
B) Inability to tolerate activity would be the priority problem for this client.
C) There is no evidence that the client is experiencing inadequate gas exchange.
D) There is no evidence that the client is experiencing acute pain.

Page Ref: 84

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with anemia.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

7) The nurse is evaluating a client's understanding of dietary needs to treat a nutritional deficiency anemia. Which client statement indicates a need for additional teaching?
A) "I will eat more fruits and vegetables, especially green leafy ones, to get more iron in my diet."
B) "I will need to include more protein foods in my diet such as meats, dried beans, and whole-grain breads."
C) "I will decrease foods high in vitamin C, as they decrease my absorption of iron."
D) "I will take vitamins with extra iron in addition to eating a balanced diet with meat to correct my anemia."
Answer: C
Explanation: A) Green leafy vegetables will increase iron in the diet.
B) Protein foods such as meats, dried beans, and whole-grain breads contain iron that will help dietary deficiency anemia.
C) Increasing foods high in vitamin C will increase absorption of iron.
D) The lack of iron is the problem that needs to be addressed. Extra iron is needed to help replace RBCs and treat the dietary deficiency anemia.
Page Ref: 76
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

8) The nurse suspects that a client with severe shortness of breath in the absence of cyanosis is experiencing anemia. Which laboratory tests should the nurse review to confirm anemia? **Select all that apply.**
A) Serum electrolytes
B) Cardiac enzymes
C) Hemoglobin
D) Blood sugar
E) Hematocrit
Answer: C, E
Explanation: A) Serum electrolytes do not cause anemia.
B) Cardiac enzymes do not cause anemia.
C) Severe anemia will interfere with the development of cyanosis, so the nurse should review the hemoglobin.
D) Blood sugar does not cause anemia.
E) Severe anemia will interfere with the development of cyanosis, so the nurse should review the hematocrit.
Page Ref: 81
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

9) The nurse is caring for a client with hemolytic anemia. When planning care for this client, which should the nurse take into consideration regarding this diagnosis?
A) It causes the red blood cells to be microcytic.
B) It is associated with a decrease in the reticulocyte count.
C) It is the result of blood loss.
D) It is a result of the premature destruction of red blood cells.
Answer: D
Explanation: A) Hemolytic anemias are normocytic (red blood cells are normal size), not microcytic.
B) Hemolytic anemia causes an increase, not a decrease, in the reticulocyte (immature red blood cells) count because they are released early from the bone marrow to compensate.
C) Hemolytic anemia is not associated with blood loss.
D) Hemolytic anemia is caused by the premature destruction of the red blood cells.
Page Ref: 81
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Describe the etiology of anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

10) The nurse is instructing a client with iron deficiency anemia about appropriate menu choices. Which diet choice indicates that teaching has been effective?

A) Tofu with mixed vegetables in curry, milk, whole-wheat bun
B) Broiled fish, lettuce salad, grapefruit half, carrot sticks
C) Pork chop, mashed potatoes and gravy, cauliflower, tea
D) Roast beef, steamed spinach, tomato soup, orange juice

Answer: D

Explanation: A) The meal of tofu with mixed vegetables in curry, milk, and a whole-wheat bun is high in calcium, but the client has iron deficiency anemia and requires a high-iron diet.

B) The meal of fish, lettuce, grapefruit, and carrot sticks is high in fiber, low in fat, and moderately high in protein, but low in iron.

C) The meal with a pork chop, mashed potatoes and gravy, cauliflower, and tea has a moderate amount of protein, but no vitamin C.

D) This client is anemic and needs iron. This meal contains iron in the beef, folic acid and iron in the spinach, and vitamin C in the tomato soup and orange juice. Vitamin C helps absorption of the iron; folic acid is needed for production of red cells.

Page Ref: 83

Cognitive Level: Analyzing

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with anemia.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

11) The nurse is educating a client with anemia about the pathophysiological mechanisms of anemia. Which should be excluded in the nurse's teaching plan for this client?
A) Altered hemoglobin synthesis
B) Altered DNA synthesis
C) Decreased hemolysis
D) Bone marrow failure
Answer: C
Explanation: A) The pathophysiological mechanisms of anemia include altered hemoglobin synthesis.
B) The pathophysiological mechanisms of anemia include altered DNA synthesis.
C) The pathophysiological mechanisms of anemia includes increased hemolysis.
D) Bone marrow failure is the mechanism in aplastic anemia, red cell aplasia, myeloproliferative leukemias, and lymphomas.
Page Ref: 75
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Essential Competencies 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Describe the etiology of anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

12) The nurse is providing discharge instructions to a client with iron deficiency anemia who is experiencing glossitis. Which statements will the nurse include in the discharge teaching for this client? **Select all that apply.**

A) Monitor the condition of the lips and tongue daily.
B) Use an alcohol-based mouthwash every 2 to 4 hours.
C) Provide frequent oral hygiene.
D) Apply a non-petroleum-based lubricating jelly or ointment to the lips after oral care.
E) Use a soft toothbrush or sponge to provide oral care.

Answer: A, C, E

Explanation: A) Glossitis, inflammation of the tongue that may cause the tongue and lips to turn red, and cheilosis (fissures or cracks at the corners of the mouth) may occur with nutritional deficiencies of iron, folate, and vitamin B_{12}. Client education should include monitoring the condition of lips and tongue daily.

B) The client should not use an alcohol-based mouthwash, as this would worsen the glossitis.

C) Glossitis, inflammation of the tongue that may cause the tongue and lips to turn red, and cheilosis (fissures or cracks at the corners of the mouth) may occur with nutritional deficiencies of iron, folate, and vitamin B_{12}. Client education should recommend providing frequent oral hygiene.

D) The client should use a petroleum-based lubricating jelly or ointment to the lips after oral care.

E) Glossitis, inflammation of the tongue that may cause the tongue and lips to turn red, and cheilosis (fissures or cracks at the corners of the mouth) may occur with nutritional deficiencies of iron, folate, and vitamin B_{12}. Client education should include oral hygiene with a soft-bristle toothbrush or sponge.

Page Ref: 85
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

13) The nurse is reviewing the different types of anemia. Which form of anemia can be prevented by a change in diet?
A) Iron deficiency anemia
B) Aplastic anemia
C) Blood loss anemia
D) Hemolytic anemia
Answer: A
Explanation: A) Nutritional causes of anemia include iron deficiency, vitamin B_{12} deficiency, and folic acid deficiency. Only nutritional anemias can be prevented by a change in diet.
B) Aplastic anemia occurs when the bone marrow fails to produce red and white blood cells.
C) Blood loss anemia recurs as a result of hemorrhage or other forms of blood loss.
D) Hemolytic anemias occur when red blood cells are destroyed prematurely.
Page Ref: 78
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.B.3. Analyze anemia as it relates to cellular regulation. Compare the risk factors for and prevention of anemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

14) The nurse is caring for several newborns with anemia. Which infant with anemia would the nurse be *least* concerned about?
A) A baby born at 32 weeks' gestation after the mother suffered from abruptio placentae
B) A baby born at 38 weeks' gestation who has a blood group incompatibility with the mother
C) A baby born at 35 weeks' gestation who suffered birth trauma to the head
D) A baby born at 39 weeks' gestation via a scheduled cesarean section
Answer: D
Explanation: A) The infants who experienced abruptio placentae may have anemia related to blood loss or hemolysis, which is much more serious than physiologic anemia of the newborn.
B) The infants who experienced blood group incompatibility may have anemia related to blood loss or hemolysis, which is much more serious than physiologic anemia of the newborn.
C) The infants who experienced birth trauma may have anemia related to blood loss or hemolysis, which is much more serious than physiologic anemia of the newborn.
D) For full-term infants with no birth complications, a normal, gradual drop in hemoglobin during the first 6 to 12 weeks of life is called physiologic anemia of the newborn. When the hemoglobin begins to drop, the bone marrow produces RBCs again, and the anemia disappears.
Page Ref: 84

Learning Outcome: 2.B. Analyze anemia as it relates to cellular regulation. Differentiate considerations for care of patients with anemia across the lifespan.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with anemia.

Exemplar 2.C Breast Cancer

1) The nurse is reviewing data collected during a health history with a client. Which data supports this client's risk for developing breast cancer? **Select all that apply.**
A) Age 60
B) Breastfed both children
C) Sister had breast cancer
D) Body mass index 22
E) Menopause at age 58
Answer: A, C, E
Explanation: A) The risk for developing breast cancer increases with age.
B) Breastfeeding lowers a person's risk for developing breast cancer.
C) Having a first-degree relative with breast cancer increases the risk.
D) Maintaining a normal body weight lowers a person's risk for developing breast cancer.
E) Menopause after the age of 55 increases the risk for developing breast cancer.
Page Ref: 88
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, breast cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

2) The nurse is instructing a group of women between the ages of 40 and 50 about early detection of breast cancer. Which information should the nurse include in this teaching?
A) Perform annual breast self-exams.
B) See a healthcare provider if there is a strong family history of breast cancer.
C) Have a yearly mammogram.
D) Have a clinical breast exam performed by a healthcare provider every 5 years.
Answer: C
Explanation: A) Breast self-exam should be done monthly.
B) Discussing a family history of breast cancer would be part of the annual breast exam performed by a healthcare provider.
C) Yearly mammography for all women over the age of 45 is encouraged, as it decreases the mortality from breast cancer, and women between ages 40 and 45 can choose to have a mammogram annually.
D) It is inappropriate for women in this age group to have a clinical breast exam every 5 years.
Page Ref: 90
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, breast cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

3) The nurse is providing education regarding possible treatment options for a client who was recently diagnosed with breast cancer. Which options will the nurse include in the teaching session? **Select all that apply.**

A) Mastectomy
B) Hormone therapy
C) Breast-conserving surgery
D) Palliative care
E) Radiation

Answer: A, B, C, E

Explanation: A) Treatment options appropriate for a client newly diagnosed with breast cancer may include mastectomy.

B) Treatment options appropriate for a client newly diagnosed with breast cancer may include hormone therapy.

C) Treatment options appropriate for a client newly diagnosed with breast cancer may include breast-conserving surgery.

D) Palliative care will only be implemented once the client's cancer is considered to be terminal in nature.

E) Treatment options appropriate for a client newly diagnosed with breast cancer may include radiation.

Page Ref: 90

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with breast cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

4) A client prescribed tamoxifen (Nolvadex) for breast cancer treatment asks the nurse how the medication works. Which response will the nurse make?
A) "Tamoxifen works by inhibiting the cellular mitosis of breast cancer."
B) "Tamoxifen works by blocking estrogen receptors on breast tissue."
C) "Tamoxifen works by binding to the DNA of breast cancer cells."
D) "Tamoxifen works by inhibiting the metabolism of breast cancer cells."
Answer: B
Explanation: A) Tamoxifen does not inhibit the cellular mitosis of breast cancer.
B) Breast cancer is dependent on estrogen for growth. Tamoxifen (Nolvadex) acts by blocking estrogen receptors; the tumor is deprived of estrogen.
C) Tamoxifen does not bind to the DNA of breast cancer cells.
D) Tamoxifen does not inhibit the metabolism of breast cancer cells.
Page Ref: 92
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with breast cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

5) The nurse instructs a client recovering from a mastectomy on ways to prevent lymphedema. Which client statement indicates that teaching has been successful?
A) "I should do the exercises on my affected arm every day."
B) "I have to take no special precautions."
C) "I should avoid cleansing my skin with soap."
D) "Eating fresh fruits and vegetables will prevent my arm from swelling."
Answer: A
Explanation: A) Range-of-motion exercises in the affected arm help develop collateral drainage and prevent the development of lymphedema.
B) The client should be instructed to protect the affected limb by not permitting blood pressure measurement and avoiding tight jewelry and clothing on the limb.
C) There is no reason for the client to avoid cleansing the skin of the affected arm with soap.
D) Consuming fresh fruits and vegetables will not prevent the development of lymphedema.
Page Ref: 96
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with breast cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

6) While completing a physical examination, the nurse suspects a client has breast cancer. Which finding caused the nurse to make this clinical determination? **Select all that apply.**
A) Rash along the inside of the right arm
B) Left nipple retraction
C) Palpable lump in the upper outer right quadrant
D) Scaliness near the right nipple
E) Pain when extending the left arm
Answer: B, C, D
Explanation: A) A rash on the arm is not a manifestation of breast cancer.
B) Manifestations of breast cancer include nipple retraction.
C) Manifestations of breast cancer include a palpable lump, usually in the upper outer quadrant.
D) Manifestations of breast cancer include scaliness of the skin.
E) Arm pain upon extension is not a manifestation of breast cancer.
Page Ref: 90
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Identify the clinical manifestations of breast cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

7) The nurse is reviewing the pathophysiology of breast cancer. Which form of breast cancer is the most malignant form?
A) Infiltrating ductal carcinoma
B) Inflammatory carcinoma of the breast
C) Carcinoma of the mammary ducts
D) Paget disease
Answer: B
Explanation: A) Infiltrating ductal carcinoma is the most common type of breast cancer.
B) The most malignant form of breast cancer is inflammatory carcinoma of the breast, which is a systemic disease.
C) Carcinoma of the mammary ducts is a category of breast cancer.
D) Paget disease is an atypical breast cancer.
Page Ref: 87
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Describe the pathophysiology of breast cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

8) A client has a family history of breast cancer, and genetic testing has revealed a mutation in *BRCA2*. Which mechanism would cause this client to develop breast cancer?
A) The cells' ability to accurately translate the RNA was impaired
B) The cells underwent mitosis rather than meiosis
C) The cells' ability to suppress tumor growth was impaired
D) The cells were stimulated to undergo rapid cell division
Answer: C
Explanation: A) *BRCA1* and *BRCA2* do not impair translation of RNA to protein.
B) Only germ cells undergo meiosis, not cancer cells.
C) Both *BRCA1* and *BRCA2* are tumor suppressor genes that help prevent the overstimulation of cell growth. If one or both are mutated, the cell's ability to suppress tumor growth is impaired.
D) *BRCA1* and *BRCA2* do not stimulate cells to undergo rapid cell division.
Page Ref: 88
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Describe the etiology of breast cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

9) The client is caring for a client recovering from surgery for breast cancer. For which reason will the nurse instruct the client to avoid wearing deodorant on the affected side?
A) Deodorant can stimulate tumor growth in remaining cancer cells.
B) Deodorant can inhibit the production of sweat, which stimulates healing.
C) Deodorant can harbor bacteria and increase the client's risk for infection.
D) Deodorant can irritate the skin and slow the healing process.
Answer: D
Explanation: A) Deodorant does not stimulate tumor growth.
B) Although deodorant with an antiperspirant may inhibit sweat production, sweat does not contribute to the healing process.
C) Deodorant does not harbor bacteria.
D) Substances like deodorant and talcum powder can irritate the skin and impede healing.
Page Ref: 95
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with breast cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

10) The nurse is providing community teaching related to risk factors for breast cancer for a group of young women. Which woman would the nurse identify as being at a higher risk for developing breast cancer at a young age?

A) A 28-year-old woman who received radiation for a spinal cord tumor at L3 during childhood
B) A 26-year-old woman who had a 32-year-old brother with breast cancer
C) A 34-year-old woman who has breastfed four children
D) A 42-year-old woman who has a second cousin diagnosed with breast cancer at age 58
Answer: B
Explanation: A) The 28-year-old woman had radiation therapy, but not to the breast or chest.
B) The risk factors include having a close relative, such as a parent or sibling, or a male relative who has had breast cancer.
C) Breastfeeding is a protective factor for developing breast cancer.
D) The 42-year-old woman had a relative, but not a close relative, with breast cancer.
Page Ref: 88

Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Differentiate considerations for care of patients with breast cancer across the lifespan.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

11) The nurse is caring for a 78-year-old client who was recently diagnosed with breast cancer. Which action will the nurse take that would be inappropriate for a younger client?
A) Discussing the woman's life expectancy
B) Arranging transportation to appointments
C) Ensuring the woman has adequate emotional support
D) Providing teaching related to breast-conservation treatments
Answer: B
Explanation: A) All clients with breast cancer should receive information related to life expectancy.
B) Older women may not have access to transportation if they or their partner do not drive. The nurse may need to help arrange transportation to appointments for these women.
C) Older women are less likely to show emotional distress compared to younger women.
D) All clients with breast cancer should receive information related to breast-conservation techniques.
Page Ref: 94
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 2.C. Analyze breast cancer as it relates to cellular regulation. Differentiate considerations for care of patients with breast cancer across the lifespan.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with breast cancer.

Exemplar 2.D Colorectal Cancer

1) The nurse is talking with a client who asked for information about colorectal cancer. Which statement indicates the teaching was effective?

A) The risk of colorectal cancer decreases with age.

B) Colorectal cancer can be detected in early stages by measuring the level of the carcinogenic embryonic antigen (CEA).

C) Colorectal cancer occurs more frequently in clients who have a history of inflammatory bowel disease.

D) Colorectal cancer has no symptoms in the early stage and there are no definitive diagnostic tests.

Answer: C

Explanation: A) Being over age 50 is a risk factor for colorectal cancer.

B) Carcinogenic embryonic antigen (CEA) is not considered a diagnostic test but is used as a tumor marker to follow and manage the disease in clients diagnosed with the disease.

C) The incidence of colorectal cancer is increased in clients with a history of inflammatory bowel disease.

D) Colorectal cancer is asymptomatic in the early stages. Screening tools such as annual fecal occult blood testing and colonoscopy performed every 10 years can detect the cancer when it is still in the curable stage.

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, colorectal cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

2) The nurse provides an educational session for community members about the risk factors for colorectal cancer. Which participant statement indicates that teaching has been effective? **Select all that apply.**

A) "There is a genetic link in the development of colorectal cancer."

B) "People with other bowel diseases are at increased risk for developing this cancer."

C) "Eating a diet high in red meat reduces the risk for developing this type of cancer."

D) "Eating cereal fiber reduces the risk of developing colorectal cancer."

E) "Taking aspirin and a multivitamin each day reduces the risk of colorectal cancer."

Answer: A, B, E

Explanation: A) Genetic factors are strongly linked to the risk for colorectal cancer. Family history of the disease increases an individual's risk for its development.

B) Inflammatory bowel diseases increase the risk of colorectal cancer.

C) The disease is prevalent in people who consume diets high in meat proteins.

D) Cereal fiber does not play a role in the development of colorectal cancer.

E) The use of aspirin and multivitamins may reduce the risk of developing colorectal cancer.

Page Ref: 98-99

Cognitive Level: Analyzing

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, colorectal cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

3) A client recovering from surgery to place a permanent colostomy as treatment for colon cancer is concerned that the spouse will not want to have sexual relations. Which response by the nurse is the most appropriate?

A) "Tell me more about the concerns you are having."

B) "Would you like me to speak with your spouse?"

C) "Do not worry about sex right now. It is more important to focus on recovery."

D) "I will refer you to a counselor to talk about your concerns."

Answer: A

Explanation: A) Since the client has expressed concern to the nurse regarding sexual functioning, the nurse should ask the client to expand upon why there are concerns.

B) Offering to speak to the spouse is not an appropriate response at this time.

C) Telling the client not to worry about the concern is not an appropriate response at this time.

D) Although a referral may be needed for the client at some point, this is not the most appropriate response by the nurse.

Page Ref: 105

Cognitive Level: Applying

Client Need/Sub: Psychosocial Integrity

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with colorectal cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

4) A client has just been told that a colectomy and ileostomy are needed to treat a new diagnosis of colon cancer. Which problem should the nurse use to plan this client's preoperative nursing care?
A) Potential fluid imbalances
B) Altered electrolyte levels
C) Potential for infection
D) Anticipatory grieving
Answer: D
Explanation: A) There is no evidence that the client will have a fluid imbalance.
B) There is no evidence that the client will have altered electrolyte levels.
C) There is no evidence that the client is at risk for an infection.
D) The client and family will require support to deal with their emotional response to learning the client has cancer and will undergo body image-changing surgery.
Page Ref: 104
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with colorectal cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

5) The nurse is evaluating care provided to a client recovering from surgery for colorectal cancer. Which outcomes indicate that care has been successful? **Select all that apply.**

A) Client reports pain level as an 8 on a rating scale of 0 to 10.

B) Client has an hourly urine output of 45 mL.

C) Client performs morning care with assistance.

D) Client states family members will care for the ostomy at home.

E) Client tolerates full liquid diet and is requesting solid food.

Answer: B, C, E

Explanation: A) Pain rating should be at a level or 3 or less as evidence of successful care.

B) Evidence that care has been effective includes an adequate hourly urine output of at least 0.5 mL/kg/hr.

C) Evidence that care has been effective includes an ability to perform activities of daily living.

D) Not participating in the care of an ostomy and stating that family will provide the care needed are evidence of ineffective coping, an undesirable outcome.

E) Evidence that care has been effective includes tolerating oral intake.

Page Ref: 106

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with colorectal cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

6) The nurse is caring for a client who has had a double-barrel colostomy. Which is true regarding the proximal stoma? **Select all that apply.**
A) It is also called the mucous fistula.
B) It diverts feces to the abdominal wall.
C) It expels mucus from the distal colon.
D) It is a functional stoma.
E) It expels mucus from the proximal colon.
Answer: B, D
Explanation: A) The distal stoma is also called the mucous fistula.
B) When a double-barrel colostomy is performed, two separate stomas are created. The distal colon is not removed, but bypassed. The proximal stoma diverts feces to the abdominal wall.
C) The distal stoma expels mucus from the distal colon.
D) The proximal stoma is functional.
E) The distal stoma expels mucus from the distal colon.

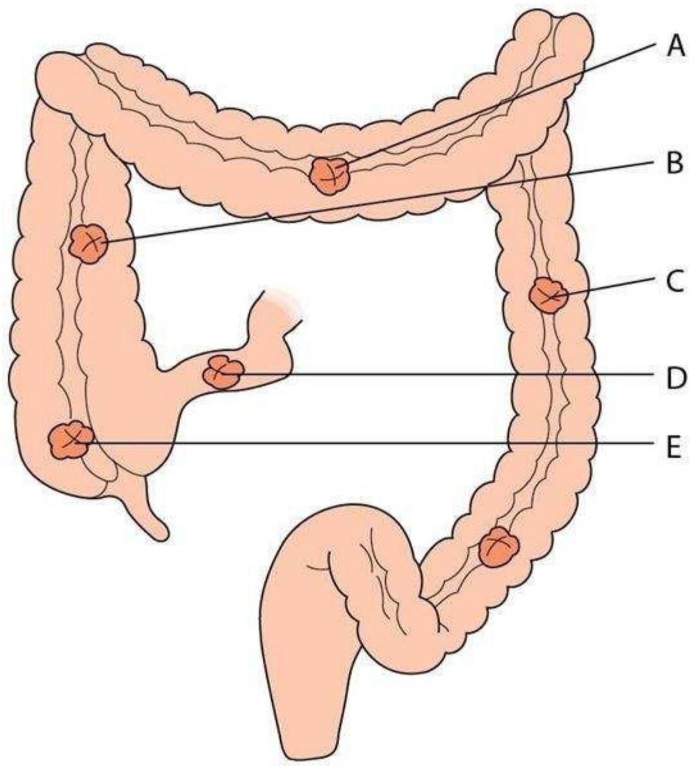
Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with colorectal cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

7) The nurse is caring for a client with colorectal cancer who is postoperative from a transverse colostomy placement. Which area of the bowel is involved?



W . B M.Ws

A) A
B) B
C) C
D) D
E) E
Answer: A
Explanation: A) Colostomies take the name of the portion of the colon from which they are formed. The transverse colon is the area of the bowel involved.
B) This is the site for an ascending colostomy.
C) This is the site of a descending colostomy.
D) This is the site for an ileostomy.
E) This is the site for a cecostomy.
Page Ref: 101
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with colorectal cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

8) A client has colorectal cancer at stage I, T2. Which area has the tumor invaded?
A) The submucosa of the bowel
B) The muscularis propria of the bowel
C) The perirectal tissues
D) The lymph nodes
Answer: B
Explanation: A) A tumor with stage T1 has invaded the submucosa.
B) A tumor with the stage T2 has invaded the muscularis propria.
C) A tumor with stage T3 has invaded the perirectal tissues.
D) A tumor that has metastasized to the lymph nodes would be given an N1 to N3 designation.
Page Ref: 99
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Describe the pathophysiology of colorectal cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

9) A client with colorectal cancer has no metastasis in regional lymph nodes. Which outcome should the nurse conclude from this about metastasis of this cancer?
A) The distal lymph nodes and other major organs will also not have metastasis.
B) The tumor has instead metastasized to distal lymph nodes.
C) The nurse cannot conclude anything about metastasis to other areas of the body.
D) The tumor has instead metastasized through the circulatory system to other major organs.
Answer: C
Explanation: A) There is not enough information to determine that the distal lymph nodes and other major organs will not have metastasis.
B) A lack of metastasis does not mean that the tumor has metastasized to distal lymph nodes.
C) In some types of cancer, the regional lymph nodes are a good marker for metastasis. However, metastasis from colorectal cancer is not always an orderly process, and the absence or presence of metastasis in regional lymph nodes has no bearing on metastasis to distal lymph nodes or other major organs.
D) A lack of metastasis does not mean that the tumor has metastasized through the circulatory system to other major organs.
Page Ref: 99
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Describe the pathophysiology of colorectal cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

10) The nurse is assessing a client. Which finding should the nurse report to the physician as a potential indication of colorectal cancer?
A) Abdominal pain
B) Constipation
C) Diarrhea
D) Rectal bleeding
Answer: D
Explanation: A) Abdominal pain can have many etiologies unrelated to colorectal cancer.
B) Constipation can have many etiologies unrelated to colorectal cancer.
C) Diarrhea can have many etiologies unrelated to colorectal cancer.
D) Rectal bleeding has fewer etiologies and should be assessed further for the potential cause.
Page Ref: 99
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Identify the clinical manifestations of colorectal cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

11) The nurse is assessing several children with polyps in the colon and rectum. Which child is at highest risk of developing colorectal cancer in adulthood?

A) A 4-year-old with isolated juvenile polyps
B) A 6-month-old with diffuse juvenile polyposis of infancy
C) A 12-year-old with juvenile polyposis coli
D) A 7-year-old with adenomatous polyps

Answer: C

Explanation: A) Isolated juvenile polyps lack malignant potential.

B) Diffuse juvenile polyposis of infancy is almost always fatal, so the client is not likely to reach adulthood.

C) Children who develop juvenile polyposis or juvenile polyposis coli have an increased risk of developing colorectal cancer in adulthood by as much as 39%.

D) Adenomatous polyps also increase the risk for malignancy as adults, but this risk is not as high as 39%.

Page Ref: 101

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Differentiate considerations for care of patients with colorectal cancer across the lifespan.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

12) The nurse is assessing an older adult client recently diagnosed with colorectal cancer. Which information should the nurse collect when completing the geriatric assessment?
A) The names, addresses, and birthdates of all of the client's children
B) The client's food diary for the past month
C) A complete list of all medications and supplements the client is currently taking
D) Whether the client has ever had a gastrointestinal disorder that caused diarrhea
Answer: C
Explanation: A) Although information related to social support is important, the nurse does not need the names, addresses, and birthdates of the client's children.
B) The client may not have a food diary for the past month unless specifically asked to record all food intake.
C) The geriatric assessment should evaluate the patient's functional status, physical performance, comorbidities, polypharmacy, nutritional status, cognitive function, emotional function, and social support. Asking for a complete list of all medications and supplements the client is currently taking will help assess polypharmacy.
D) A past history of gastrointestinal disorders is not as important as current comorbidities.
Page Ref: 103
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Learning Outcome: 2.D. Analyze colorectal cancer as it relates to cellular regulation. Differentiate considerations for care of patients with colorectal cancer across the lifespan.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with colorectal cancer.

Exemplar 2.E Leukemia

1) A client is receiving chemotherapy for acute lymphocytic leukemia. While providing care for this client, which clinical manifestations would indicate tumor lysis syndrome? **Select all that apply.**

A) Thrombocytopenia
B) Cardiac arrhythmia
C) Respiratory distress
D) Changes in urine output
E) Upper-extremity edema

Answer: B, D

Explanation: A) Thrombocytopenia occurs with a hematological emergency.

B) Tumor lysis causes a metabolic emergency. The release of intracellular contents into the circulation cause hyperkalemia, hyperuricemia, and hyperphosphatemia, which may lead to cardiac arrhythmias.

C) Space-occupying lesions can cause respiratory distress.

D) Tumor lysis causes a metabolic emergency. The release of intracellular contents into the circulation cause hyperkalemia, hyperuricemia, and hyperphosphatemia, which may lead to renal failure.

E) Space-occupying lesions can cause upper-extremity edema.

Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with leukemia.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

2) An adult client reports an inability to tolerate usual exercise and the feeling of fatigue that has progressed over time. Which physical assessment findings, along with the client's verbal complaints, would indicate chronic lymphocytic leukemia (CLL)? **Select all that apply.**
A) Joint pain
B) Pallor
C) Splenomegaly
D) Abnormal bleeding
E) Edema
Answer: B, C, E
Explanation: A) Joint pain is a characteristic of acute myeloid leukemia (AML).
B) The symptoms for CLL are insidious and occur over time. The client may exhibit pallor.
C) The symptoms for CLL are insidious and occur over time. The client may exhibit splenomegaly.
D) Abnormal bleeding is a characteristic of acute myeloid leukemia (AML).
E) The symptoms for CLL are insidious and occur over time. The client may exhibit edema.

Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Describe the pathophysiology of leukemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

3) The nurse is teaching a class about decreasing risk factors for cancer. Which risk factors should the nurse include in the teaching regarding leukemia? **Select all that apply.**
A) Smoking
B) Diets low in fat
C) Exposure to infectious agents
D) Bloom syndrome
E) Decreased exercise
Answer: A, C, D
Explanation: A) A higher incidence of leukemia is associated with cigarette smoking.
B) Low-fat diets are not a risk factor for leukemia.
C) A higher incidence of leukemia is associated with exposure to infectious agents.
D) A higher incidence of leukemia is associated with chromosomal defects such as Bloom syndrome.
E) Lack of exercise is not a risk factor for leukemia.
Page Ref: 110
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Compare the risk factors for, and prevention of, leukemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

4) The nurse is planning care for a client with acute myeloid leukemia (AML). Which problems are priorities for this client to minimize the risk of complications associated with AML? **Select all that apply.**
A) Potential for infection
B) Heat intolerance
C) Weight loss
D) Excessive fluid volume
E) Potential for bleeding
Answer: A, E
Explanation: A) AML results in neutropenia (decreased neutrophils = risk of infection).
B) The client with AML does not have a problem with heat intolerance.
C) The client with AML does not have a problem with weight loss that would require nursing intervention.
D) The client with AML does not have a problem with fluid balance.
E) AML results in thrombocytopenia (decreased platelets, which leads to increased risk of bleeding).
Page Ref: 118
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with leukemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

5) The interprofessional team is meeting to plan care for a school-age child with acute lymphocytic leukemia and the family. Which statement by the parents should receive priority in the nursing planning process?
A) "His brother is upset about the amount of time we are away from home."
B) "Can we plan a trip out of town sometime this summer?"
C) "We are afraid that he will dislodge his central line at school."
D) "How are we going to pay for his treatment?"
Answer: C
Explanation: A) The impact of the illness on the client's brother is a realistic concern, but not acute or life-threatening.
B) Questions about travel should be addressed, but they are not acute issues.
C) Dislodging the central line is an imminent, potentially life-threatening concern.
D) Financial worries, although a significant concern, would not take precedence over a potentially life-threatening concern.
Page Ref: 119
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: The role of family, culture, and community in a person's development. | Nursing Process: Planning
Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with leukemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

6) The nurse is caring for a client with leukemia and thrombocytopenia. Which action will the nurse make a priority after the client has a bone marrow aspiration and biopsy?
A) Dispose of the equipment used and clean the area properly.
B) Label and refrigerate the specimen obtained by the physician.
C) Hold pressure on the wound for approximately 5 minutes.
D) Make certain the client understands the purpose of the test.
Answer: C
Explanation: A) Cleaning the area is completed after the client is stable and the specimen is sent to the laboratory.
B) Dealing with the specimen is accomplished by a third party or after the nurse stabilizes the client.
C) The most important task for the nurse is to prevent bleeding after the biopsy. Holding pressure on the wound for 5 minutes is effective.
D) An explanation of the test is performed before the procedure is begun.
Page Ref: 112
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with leukemia.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

7) The nurse is caring for a client with leukemia who is experiencing neutropenia as a result of chemotherapy. Which action should the nurse include in the plan of care for this client?
A) Replace hand hygiene with gloves.
B) Restrict visitors with communicable illnesses.
C) Restrict fluid intake.
D) Insert an indwelling urinary catheter to prevent skin breakdown.
Answer: B
Explanation: A) Gloves may be appropriate but should never replace hand hygiene.
B) In the neutropenic client, visitors with communicable infections should be restricted.
C) Fluid intake should be encouraged.
D) Invasive procedures such as indwelling catheters should be avoided.
Page Ref: 119

Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with leukemia.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

8) The nurse is caring for a child with leukemia. Which type of leukemia is most common in children?
A) Chronic lymphocytic leukemia (CLL)
B) Acute lymphocytic (lymphoblastic) leukemia (ALL)
C) Acute myeloid (myeloblastic) leukemia (AML)
D) Chronic myeloid (myelogenous) leukemia (CML)
Answer: B
Explanation: A) CLL is more common in adults and is not common in children.
B) Acute lymphoblastic leukemia is the most common type of leukemia in children and adolescents.
C) AML is common in adults and is not common in children.
D) CML is common in adults and is not common in children.
Page Ref: 109
Cognitive Level: Remembering

Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Differentiate considerations for care of patients with leukemia across the lifespan.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

9) The nurse is caring for a child with acute lymphoblastic leukemia (ALL). When providing education to the child's parents regarding this disease, which topics should the nurse include? **Select all that apply.**

A) ALL is characterized by abnormal proliferation of all bone marrow elements.
B) This form of leukemia is the most common type among children and adolescents.
C) Most cases of ALL result from a genetic alteration.
D) Malignant lymphocytes are able to effectively maintain immunity.
E) The onset of ALL is usually gradual.

Answer: B, C

Explanation: A) Chronic myeloid leukemia (CML) is characterized by abnormal proliferation of all bone marrow elements.
B) Acute lymphoblastic leukemia (ALL) is the most common type of leukemia among children and adolescents.
C) Most cases of ALL result from a genetic alteration.
D) Malignant lymphocytes are immature and do not function effectively to maintain immunity.
E) The onset of ALL is usually acute and rapid.

Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Describe the pathophysiology of leukemia.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

10) The nurse is caring for a client with chronic myeloid leukemia (CML) who is neutropenic. Which interventions will the nurse implement to ensure this client's safety? **Select all that apply.**
A) Teach the client to maintain good personal hygiene.
B) Encourage the client to eat a diet low in protein.
C) Administer granulocyte colony-stimulating factor (G-CSF) as ordered.
D) Administer neutrophil colony-stimulating factor (N-CSF) as ordered.
E) Administer a prophylactic gram-negative antibiotic.
Answer: A, C
Explanation: A) A client who is neutropenic has a decrease in the level of white blood cells (WBCs) and is susceptible to infection and/or disease. To ensure the safety of the client with neutropenia, the nurse will teach the client to maintain good personal hygiene.
B) The client should be taught to eat a diet high in protein, not low in protein.
C) A client who is neutropenic has a decrease in the level of white blood cells (WBCs) and is susceptible to infection and/or disease. To ensure the safety of the client with neutropenia, the nurse will administer granulocyte colony-stimulating factor (G-CSF) as ordered.
D) The client will not receive neutrophil colony-stimulating factor (N-CSF).
E) Broad-spectrum antibiotics as ordered will be used.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

11) The nurse is planning care for a client with leukemia. Which actions will the nurse take to reduce this client's risk for bleeding? **Select all that apply.**
A) Educate client to not strain during bowel movements.
B) Use nonelectric razor when providing grooming for client.
C) Limit parenteral injections.
D) Apply pressure to arterial puncture sites for 5 minutes.
E) Encourage client to breathe deeply and huff cough frequently.
Answer: A, C
Explanation: A) The client at risk for bleeding has specific interventions to which the nurse should adhere. The nurse should educate the client to not strain during bowel movements.
B) The nurse should educate the client to use an electric razor to avoid bleeding.
C) The nurse should also limit the use of parenteral injections.
D) The nurse should apply 15 to 20 minutes of pressure to any arterial puncture sites.
E) The nurse should discourage the client from forceful coughing to prevent further bleeding.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

12) A client reports easily bruising, bleeding gums, and petechiae. Which complication of leukemia should the nurse consider the client is experiencing?

A) Thrombocytopenia
B) Anemia
C) Hepatomegaly
D) Neutropenia

Answer: A

Explanation: A) The manifestations of thrombocytopenia, a common complication of leukemia, include petechiae, purpura, ecchymoses, epistaxis, hematomas, hematuria, and gastrointestinal bleeding.

B) Anemia can be a late manifestation of thrombocytopenia.

C) Hepatomegaly is an enlarged liver.

D) Neutropenia increases the risk of infection in clients with leukemia.

Page Ref: 110

Cognitive Level: Understanding

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies:AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 2.E. Analyze leukemia as it relates to cellular regulation. Identify the clinical manifestations of leukemia.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with leukemia.

Exemplar 2.F Lung Cancer

1) The nurse is caring for a client in a community clinic who wishes to quit smoking. The client asks the nurse, "If I quit smoking, will my risk of lung cancer be the same as a nonsmoker?" Which is the best response by the nurse?
A) "No one knows for sure what the risk is for someone who quits smoking."
B) "Your risk of lung cancer will be equal to that of a nonsmoker."
C) "Your risk of lung cancer will decline if you quit, but it will remain higher than a nonsmoker's."
D) "Your risk of lung cancer will never drop because the damage has already been done."
Answer: C
Explanation: A) The risk for someone who quits is known to be dramatically less than for someone who continues to smoke.
B) The risk for someone who quits is known to be dramatically less than for someone who continues to smoke.
C) While the client's risk for lung cancer will diminish sharply upon quitting smoking, it will not drop to the level of someone who never smoked.
D) The risk for someone who quits is known to be dramatically less than for someone who continues to smoke.
Page Ref: 123
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Implementation
Learning Outcome: 2.F. Analyze lung cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, lung cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with lung cancer.

2) The nurse is planning care to maintain the airway of a client with lung cancer. Which interventions should the nurse include in the client's plan of care? **Select all that apply.**
A) Suction the airway as needed.
B) Help the client turn, cough, and deep breathe as needed.
C) Provide chest percussion as ordered.
D) Educate the client about smoking cessation.
E) Administer pneumococcal vaccine.
Answer: A, B, C
Explanation: A) Suctioning can help clear secretions and improve airway clearance.
B) Turning, coughing, and deep breathing can help clear secretions and improve airway clearance.
C) Chest percussion can help clear secretions and improve airway clearance.
D) Educating the client on smoking cessation will not help maintain the client's airway.
E) Administering the pneumococcal vaccine will not help maintain the client's airway.
Page Ref: 129
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 2.F. Analyze lung cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with lung cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with lung cancer.

3) The nurse is caring for a client recovering from a wedge resection of the left lung for a tumor. Which goals will the nurse identify to enhance this client's airway clearance? **Select all that apply.**

A) Minimize accumulation of fluid
B) Participation in care by the client
C) Maintain a patent airway
D) Maintain current weight
E) Express feelings and concerns

Answer: A, C

Explanation: A) An appropriate outcome to maintain airway clearance would be to minimize the accumulation of fluid.
B) Participating in care will not help with airway clearance.
C) An appropriate outcome to maintain airway clearance would be to maintain a patent airway.
D) Maintaining current weight will not help with airway clearance. All of the outcomes for this client are viable, but appropriate outcomes for the diagnosis of ineffective airway clearance are maintaining a patent airway and minimizing the accumulation of fluid.
E) Expressing feelings and concerns will not help with airway clearance.

Page Ref: 128
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | Nursing Process: Planning
Learning Outcome: 2.F. Analyze lung cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with lung cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with lung cancer.

4) A client experiencing symptoms of lung cancer asks why a computed tomography (CT) scan was ordered. Which response will the nurse make?
A) "The doctor prefers this test."
B) "To rule out the possibility that your problems are caused by pneumonia."
C) "It is more specific in diagnosing your condition."
D) "Why are you concerned about this test?"
Answer: C
Explanation: A) A CT scan is not done because the healthcare provider prefers the test.
B) A chest x-ray can be used to diagnose pneumonia.
C) Computed tomography (CT) is used to evaluate and localize tumors, particularly tumors in the lung parenchyma and pleura. It also is done before needle biopsy to localize the tumor. In addition, CT scanning can detect distant tumor metastasis and evaluate tumor response to treatment.
D) The client's question is valid and should not be minimized by asking why the client is having concerns about the test.
Page Ref: 126
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 2.F. Analyze lung cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with lung cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with lung cancer.

5) The nurse is reviewing the different types of lung cancer. Which type of lung cancer typically spreads by local invasion?
A) Small-cell carcinoma
B) Adenocarcinoma
C) Squamous cell carcinoma
D) Large-cell carcinoma
Answer: C
Explanation: A) Small-cell carcinoma has distant metastasis early in the course of the disease.
B) Adenocarcinoma has distant metastasis early in the course of the disease.
C) Squamous cell carcinoma tends to spread by local invasion.
D) Large-cell carcinoma has distant metastasis early in the course of the disease.
Page Ref: 122
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.F. Analyze lung cancer as it relates to cellular regulation. Describe the pathophysiology of lung cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with lung cancer.

6) The nurse is preparing a teaching tool about lung cancer. Which individuals are more likely to develop lung cancer without a history of smoking?
A) An individual under age 50
B) An individual with a genetic abnormality on chromosome 6
C) An individual over age 50
D) An individual with a genetic abnormality on chromosome 8
Answer: B
Explanation: A) Although incidence does increase with age, age is not a risk factor for lung cancer in nonsmokers.
B) Individuals with a genetic abnormality on chromosome 6 are more likely to develop lung cancer regardless of their smoking history.
C) Although incidence does increase with age, age is not a risk factor for lung cancer in nonsmokers.
D) Individuals with a genetic abnormality on chromosome 6, not chromosome 8, are more likely to develop lung cancer regardless of their smoking history.
Page Ref: 122
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.F. Analyze lung cancer as it relates to cellular regulation. Describe the etiology of lung cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with lung cancer.

7) A client with lung cancer is experiencing dysphagia. Which location should the nurse suspect is the location of this client's tumor?
A) By the trachea
B) By the esophagus
C) By the mediastinum
D) By the pleura
Answer: B
Explanation: A) Hoarseness indicates pressure on the trachea.
B) Signs and symptoms can provide an indication of the location of the tumor associated with lung cancer. Dysphagia indicates pressure on the esophagus.
C) Dull, aching chest pain occurs as the tumor spreads to the mediastinum.
D) Pleuritic pain occurs when the pleura is invaded.
Page Ref: 123
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies:AACN Domains and Competencies: 2.3 Integrate assessment skills in practice | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.F. Analyze lung cancer as it relates to cellular regulation. Identify the clinical manifestations of lung cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with lung cancer.

8) The nurse is caring for a 72-year-old client who was just diagnosed with early-stage lung cancer. Which independent nursing intervention can improve the client's prognosis?
A) Provide client teaching related to a nutritional diet
B) Refer the client to a smoking cessation therapy group
C) Advocate for an immediate initiation of treatment
D) Encourage the client to form a strong support group
Answer: C
Explanation: A) A nutritional diet could also be helpful, but it likely will not affect the prognosis significantly.
B) A smoking cessation therapy group could be helpful, but at this client's age and recent diagnosis, a therapy group is not as important as initiating treatment.
C) Studies have indicated that delays in the time from diagnosis to initiation of treatment may affect the patient's prognosis in older adults. Delays in diagnosis and treatment should be avoided to prevent the risk of disease progression.
D) Support groups can provide emotional support to the client, but this will not improve the client's prognosis as much as early treatment.
Page Ref: 128
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.9 Provide care coordination. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 2.F. Analyze lung cancer as it relates to cellular regulation. Differentiate considerations for care of patients with lung cancer across the lifespan.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with lung cancer.

WwW.TeSt.Wo

9) The nurse is providing discharge teaching to an older adult client with lung cancer. Which changes in activities of daily living can the nurse suggest to help the older adult maintain independence?
A) Wear shirts with buttons
B) Use a self-leveling spoon
C) Wear shoes with laces
D) Use a shower chair
Answer: D
Explanation: A) Wearing slip-on shirts, not shirts with buttons, can help conserve energy.
B) Self-leveling spoons are important for individuals who have hand tremors; they do not help conserve energy when feeding.
C) Wearing slip-on shoes, not shoes with laces, can help conserve energy.
D) Lung cancer reduces the amount of functional lung tissue, leading to activity intolerance when oxygen supply is insufficient. The nurse should teach the client ways to conserve energy, such as sitting on a shower chair while showering.
Page Ref: 129
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 2.F. Analyze lung cancer as it relates to cellular regulation. Differentiate considerations for care of patients with lung cancer across the lifespan.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with lung cancer.

Exemplar 2.G Prostate Cancer

1) A nurse is screening a client for prostate cancer. Which assessment findings would cause the nurse to suspect that the client has prostate cancer? **Select all that apply.**
A) Fatigue
B) Upper extremity weakness
C) Back pain
D) Hematuria
E) Scrotal edema
Answer: A, C, D
Explanation: A) Fatigue is a symptom of prostate cancer.
B) Upper extremity weakness is not a symptom of prostate cancer.
C) Back pain is a symptom of prostate cancer.
D) Hematuria is a symptom of prostate cancer.
E) Scrotal edema is not a symptom of prostate cancer.
Page Ref: 133
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Identify the clinical manifestations of prostate cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

2) The nurse is preparing an educational program on risk factors for the development of prostate cancer. Which information will the nurse include as being the greatest risk factor for developing prostate cancer?
A) The client's age
B) A family history
C) A history of a vasectomy
D) A diet high in fat
Answer: A
Explanation: A) The greatest risk for developing prostate cancer is age.
B) A family history is another risk factor but is not the greatest risk factor.
C) Having had a vasectomy increases the risk but is not the greatest risk factor.
D) A high fat diet is a risk factor but is not the greatest risk factor.
Page Ref: 132
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Implementation
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, prostate cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

3) While receiving discharge teaching, an adult client recovering from a prostatectomy is distressed to learn that episodes of incontinence may occur. Which should the nurse teach the client to help minimize incontinence?
A) Proper administration of incontinence medication
B) Steps to change the indwelling catheter bag every day
C) Fluid restriction
D) Kegel exercises
Answer: D
Explanation: A) Medication is not an appropriate long-term treatment for this complication.
B) An indwelling catheter is not an appropriate long-term treatment for this complication.
C) Restricting fluids may cause further urinary problems and is not advised.
D) Urinary incontinence after surgery is not unexpected. Teaching the client Kegel exercises is the best way to help eliminate or reduce occasions of stress incontinence.
Page Ref: 138
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with prostate cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

4) A client having a prostatectomy asks if there will be any limitations after the surgery. Which complications is the client likely to have that should be incorporated into the plan of care? **Select all that apply.**
A) Constipation
B) Gynecomastia
C) Urinary stress incontinence
D) Risk for falls
E) Sexual dysfunction
Answer: C, E
Explanation: A) There is no reason to suspect that this client is at risk for constipation.
B) Gynecomastia is a side effect of treatment with estrogen compounds, not surgery.
C) Following a prostatectomy, the client is most at risk for urinary stress incontinence.
D) There is no reason to suspect that this client is at risk for falls.
E) Following a prostatectomy, the client is most at risk for sexual dysfunction.
Page Ref: 134
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with prostate cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

5) The nurse is asked to explain which clients are at risk for prostate cancer. Which response will the nurse make?
A) "African American men are at lowest risk for prostate cancer."
B) "Asian American and Native American men have the highest risk for developing prostate cancer."
C) "Approximately one in twelve men ages 70 and older will be diagnosed with prostate cancer."
D) "A diet low in dairy increases a man's risk for developing prostate cancer."
Answer: C
Explanation: A) African Americans are at a particularly high risk for developing prostate cancer.
B) African Americans are at a particularly high risk for developing prostate cancer.
C) Approximately one in twelve men ages 70 and older will be diagnosed with prostate cancer.
D) A diet high in dairy increases a man's risk for developing prostate cancer.
Page Ref: 132
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, prostate cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

6) The nurse is assessing a client for symptoms of prostate cancer. Which symptoms would indicate the client is experiencing an enlarged prostate? **Select all that apply.**
A) Hematuria
B) Dysuria
C) Weight loss
D) Bone pain
E) Fatigue
Answer: A, B
Explanation: A) Symptoms of an enlarged prostate includes hematuria.
B) Symptoms of an enlarged prostate includes dysuria.
C) Weight loss is a symptom of metastasis.
D) Bone pain is a symptom of metastasis.
E) Fatigue is a symptom of metabolic changes.
Page Ref: 133
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Identify the clinical manifestations of prostate cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

7) A client with prostate cancer is being discharged from the hospital. Which educational topic is least appropriate for this client?
A) Provide information on doses of complementary herbs.
B) Teach the client and his family methods of pain control.
C) Stress the importance of keeping client appointments with healthcare providers.
D) Provide the client and the client's family information on support groups.
Answer: A
Explanation: A) The nurse does not have authorization to provide information on doses of complementary herbs.
B) When providing discharge instructions to the client with prostate cancer, the nurse will teach the client and family methods of pain control.
C) When providing discharge instructions to the client with prostate cancer, the nurse will stress the importance of keeping client appointments with healthcare providers.
D) The nurse will provide the client and family information on support groups.
Page Ref: 138
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with prostate cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

8) The nurse is reviewing the pathophysiology of prostate cancer. Which hormones are believed to have a role in the development of prostate cancer?
A) Prolactin
B) Endorphins
C) Estrogens
D) Androgens
Answer: D
Explanation: A) Prolactin has not been linked to the development of prostate cancer.
B) Endorphins have not been linked to the development of prostate cancer.
C) Estrogens have not been linked to the development of prostate cancer.
D) Androgens are hormones synthesized in the testes and adrenal cortex in males that promote expression of male sex characteristics. They are believed to have a role in the development of prostate cancer.
Page Ref: 132
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Describe the pathophysiology of prostate cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

9) The nurse is reviewing the potential for metastasis from prostate cancer. For which reason is it rare for this type of cancer to metastasize to the bowel?
A) The capsular artery supplies blood to the bowel before the prostate.
B) The inferior vesical artery supplies blood to the bowel before the prostate.
C) The rectourethral fistula acts as a physical barrier to metastasis.
D) The rectoprostatic fascia acts as a physical barrier to metastasis.
Answer: D
Explanation: A) The capsular artery provides blood to the prostate but not the bowel.
B) The inferior vesical artery provides blood to the prostate but not the bowel.
C) A rectourethral fistula may develop as a result of treatment for prostate cancer.
D) Despite its proximity to the rectum, metastasis to the bowel is uncommon in prostate cancer, because a tough sheet of tissue, the rectoprostatic fascia, acts as an effective physical barrier between the bowel and prostate.
Page Ref: 132
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Describe the pathophysiology of prostate cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

10) The nurse is reviewing laboratory values for a client being tested for prostate cancer. Which approach is appropriate for interpreting the prostate-specific antigen (PSA) level?
A) A PSA level higher than 4.0 ng/mL indicates prostate cancer.
B) A PSA level lower than 4.0 ng/mL indicates prostate cancer.
C) A fluctuating PSA level indicates prostate cancer.
D) An abnormal PSA level alone is not enough to diagnose prostate cancer.
Answer: D
Explanation: A) The National Cancer Institute used to consider a PSA level of 4.0 ng/mL or lower to be normal, but men with normal PSA levels may still have prostate cancer.
B) The National Cancer Institute used to consider a PSA level of 4.0 ng/mL or lower to be normal, but men with normal PSA levels may still have prostate cancer.
C) PSA levels that fluctuate could be an indication of prostate cancer, but it could also indicate prostatitis or urinary tract infection.
D) PSA levels must be interpreted in conjunction with the patient's health history and other diagnostic tests to confirm a diagnosis of prostate cancer.
Page Ref: 133
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Integration of knowledge from nursing and other disciplines. | Nursing Process: Assessment
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with prostate cancer.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

11) A 42-year-old male client was recently diagnosed with prostate cancer. Which characteristic of this disease does the nurse need to be aware of for a client of this age compared to older men with prostate cancer?

A) The cancer will likely be more aggressive for the younger client.
B) The cancer will likely grow more slowly in the younger client.
C) The cancer will likely be more responsive to treatment in the younger client.
D) The cancer will likely not metastasize as quickly in the younger client.

Answer: A

Explanation: A) Research has found that prostate cancers that are diagnosed at a younger age tend to be more aggressive.

B) Evidence has not yet shown whether prostate cancer grows more slowly in younger clients.

C) Evidence has not yet shown whether prostate cancer responds to treatment better in younger clients.

D) Research has found that metastasis may have already occurred, given the advanced disease state at the time of diagnosis.

Page Ref: 137

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Differentiate considerations for care of patients with prostate cancer across the lifespan.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

12) The spouse of an older client cries and asks how long the client has to live after being diagnosed with prostate cancer. Which response by the nurse is appropriate?
A) "Don't worry about how long he will live. Just live every day to the fullest and enjoy the time you have left together."
B) "If we treat the cancer aggressively with surgery and radiation, he should live several more years."
C) "Prostate cancer is usually aggressive in older men, so he may only have a short time to live."
D) "Older men who are diagnosed with prostate cancer usually die from causes other than the cancer."
Answer: D
Explanation: A) The nurse should not dismiss the client's or client's family's concerns by telling them to not worry.
B) Early-stage prostate cancer in older men may not be treated aggressively. Instead, the healthcare team may take a more conservative "watchful waiting" approach, depending on other health conditions.
C) The nurse cannot predict how long the client may live after diagnosis. Prostate cancer is usually aggressive in younger men, not older men.
D) In an older man with a lower stage of cancer at diagnosis, the cancer is likely slow-growing, and he is more likely to die from other preexisting comorbidities than from the cancer itself.
Page Ref: 137
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 2.G. Analyze prostate cancer as it relates to cellular regulation. Differentiate considerations for care of patients with prostate cancer across the lifespan.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with prostate cancer.

Exemplar 2.H Sickle Cell Disease

1) Parents of a newborn infant are concerned that their baby may have sickle cell disease since both parents have the sickle cell trait. Which response should the nurse make to the parents?

A) "Since neither of you actually has sickle cell disease, your baby is not at risk."

B) "Your baby has the disease, as you both carry the trait."

C) "We are required to test all babies for sickle cell disease."

D) "Have you talked to a genetic counselor about your concerns?"

Answer: C

Explanation: A) Because both parents only have the sickle cell trait, the baby has a 25% chance of having sickle cell disease.

B) The nurse can assure the parents that the baby will be tested so they know for sure if the baby has sickle cell disease.

C) In the United States, newborn screening for sickle cell disease is mandatory.

D) A genetic counselor is not needed at this time.

Page Ref: 144

Cognitive Level: Applying

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with sickle cell disease.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

2) The nurse is teaching a group of parents how to prevent a sickle cell crisis in the child with sickle cell disease. Which precipitating factors that could contribute to a sickle cell crisis should the nurse teach the parents? **Select all that apply.**
A) Increased fluid intake
B) High altitudes
C) Fever and infection
D) Emotional or physical stress
E) Warm temperatures
Answer: B, C, D
Explanation: A) Increased fluid intake is recommended for a child with sickle cell disease and will not contribute to a sickle cell crisis.
B) High altitude is a precipitating factor that contributes to a sickle cell crisis.
C) Fever and infection increases the risk for a sickle cell crisis.
D) Emotional or physical stress increase the risk for a sickle cell crisis.
E) Cold temperatures, not warm temperatures, are a trigger for sickle cell crisis.
Page Ref: 142, 146
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Describe the etiology of sickle cell disease.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

3) The nurse is assigned to care for a client with sickle cell disease who is being admitted with splenic sequestration crisis. Which room would be the most appropriate for this client?
A) Private room
B) Semi-private room
C) Contact-isolation room
D) Airborne-isolation room
Answer: A
Explanation: A) Splenic sequestration can be life-threatening, and there is profound anemia. The client should not be placed in a room with any other client who might have an infectious illness.
B) The client should not be placed in a room with any other client who might have an infectious illness, so a semi-private room is not appropriate.
C) The client is not contagious; therefore, contact isolation is not required.
D) The client is not contagious; therefore, an airborne isolation room is not necessary.
Page Ref: 143
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Describe the pathophysiology of sickle cell disease.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

4) A client in sickle cell crisis reports a pain level of 8 on a pain scale from 1 to 10. Which problem is a priority for this client?
A) Excessive body fluids
B) Risk for self-harm
C) Lack of understanding about the crisis
D) Experiencing pain
Answer: D
Explanation: A) There is no evidence from the information given that the client has fluid volume excess.
B) There is no evidence from the information given that the client is at risk for self-harm.
C) This client appears to have a knowledge deficit about self-care.
D) The priority for this client would be pain.
Page Ref: 143
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with sickle cell disease.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

5) A client in sickle cell crisis has a temperature of 102°F, O_2 saturation of 89%, and complaints of severe abdominal pain. Based on the assessment findings, which intervention is the greatest priority?
A) Apply oxygen per nasal cannula at 3 L/minute.
B) Assess and document peripheral pulses.
C) Administer morphine sulfate 10 mg IM.
D) Administer Tylenol 650 mg by mouth.
Answer: A
Explanation: A) Hypoxia is often the cause of a sickle cell crisis from the clumping of damaged RBCs, which creates an obstruction and hypoxia distal to the clumping. Administering the oxygen will improve the pain and increase the oxygen saturation of body tissues.
B) Full body assessment, including peripheral pulses, is significant to identify the location of the potential obstruction, but this is secondary to treating the hypoxia that is known to be present from the sickling of the cells during sickle cell crisis.
C) Morphine sulfate is a narcotic for pain, but it should be given after the oxygen is started, since the symptoms are caused by hypoxia. The morphine will decrease the pain and decrease metabolic oxygen needs by decreasing basal metabolic rates; therefore, supply is increased and demand is increased.
D) Tylenol is not the first action the nurse should take, because a sickle cell crisis is caused by oxygen deprivation in tissues, not by the fever.
Page Ref: 148
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies:AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with sickle cell disease.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

6) The nurse is planning care for a young child with sickle cell crisis whose parents have limited information about the disease. When planning care for this family, the nurse will set which goal with this family?
A) The child will drink adequate amounts of fluid each day.
B) The child will play outside in the sun.
C) The family will not have the child vaccinated.
D) The family will plan vacations in high-altitude areas.
Answer: A
Explanation: A) For the client with sickle cell disease, dehydration can lead to life-threatening consequences. The client's oral intake should be adjusted as necessary to keep the child well hydrated. Teach clients and parents how to monitor intake and output and provide client teaching regarding fluid management.
B) Playing outdoors in the sun can lead to dehydration, which can precipitate a crisis.
C) Infection and illnesses with fever will increase the body's demand for oxygen, so it is important for the family to keep up with the child's immunization schedule.
D) Oxygen supply at high altitudes is too low for the client with sickle cell disease.
Page Ref: 148
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with sickle cell disease.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

7) The nurse is caring for a client who was admitted to a medical-surgical unit in sickle cell crisis. Which medication should the nurse expect to administer to this client?
A) Acetaminophen (Tylenol)
B) Ibuprofen (Advil)
C) Meperidine (Demerol)
D) Hydroxyurea
Answer: D
Explanation: A) Acetaminophen is used for mild pain but would not be effective for the severe pain experienced by a client in sickle cell pain crisis.
B) Ibuprofen is used for mild pain, but would not be effective for the severe pain experienced by a client in sickle cell pain crisis.
C) Meperidine is not used for pain control for clients in sickle cell crisis because it can cause seizures.
D) Hydroxyurea decreases production of abnormal blood cells and leads to a lesser amount of pain being experienced.
Page Ref: 143
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with sickle cell disease.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

8) A 3-year-old client receiving treatment for sickle cell disease is at risk for infection. Which medication does the nurse expect to administer to this client?

A) Acetaminophen
B) Penicillin
C) Morphine sulfate
D) Tamoxifen

Answer: B

Explanation: A) Acetaminophen may be given for the pain the client experiences during a sickle cell crisis.

B) Prophylactic penicillin is often prescribed to children between the ages of 2 months and 5 years of age who are diagnosed with sickle cell disease because of the increased risk for infection.

C) Morphine may be given for the pain the client experiences during a sickle cell crisis.

D) Tamoxifen is a medication used to treat breast cancer.

Page Ref: 144

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with sickle cell disease.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

9) The nurse is educating the client with sickle cell disease and the family regarding the genetic implications of the disease. Which information is inappropriate for the nurse to share with the client's family?
A) If both parents have the trait, then with each pregnancy, the risk of having a child with the disease is 50%.
B) The disorder is transmitted as an autosomal recessive genetic defect.
C) The sickle cell gene may have originated to protect against lethal forms of malaria.
D) In African Americans, sickle cell disease occurs in 1 of every 365 births.
Answer: A
Explanation: A) If both parents have the trait, then with each pregnancy, the risk of having a child with the disease is 25%, not 50%.
B) In educating the client and the client's parents regarding sickle cell disease, the nurse will state that the disorder is transmitted as an autosomal recessive genetic defect.
C) The sickle cell gene may have originated to protect against lethal forms of malaria.
D) In African Americans, sickle cell disease occurs in 1 of every 365 births.
Page Ref: 141
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Describe the etiology of sickle cell disease.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

10) An emergency department nurse is caring for a child in sickle cell crisis. The nurse suspects the etiology of the crisis as being thrombotic in nature because of which clinical manifestations? **Select all that apply.**

A) The client has profound pallor and fatigue.
B) The client is in extreme pain.
C) The client has profound hypotension and shock.
D) The client has a fever.
E) The client's chest CT reveals a pulmonary infarct.

Answer: B, D

Explanation: A) The client with profound pallor and fatigue likely is in an aplastic crisis, not thrombosis.
B) A thrombotic sickle cell crisis is manifested by extreme pain.
C) The client in profound hypotension and shock likely has splenic sequestration as the etiology, not thrombosis.
D) A thrombotic sickle cell crisis is manifested by fever.
E) The client with a pulmonary infarct likely has acute chest syndrome, not thrombosis.

Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Identify the clinical manifestations of sickle cell disease.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

WW.TBSM.WS

11) A client with sickle cell disease is experiencing extreme pain. Which intervention is inappropriate for the nurse to include in this plan of care?
A) Administer prescribed analgesic medications around the clock.
B) Place client in a position of comfort.
C) Use heat or cold packs as tolerated.
D) Support the client's joints and extremities with pillows.
Answer: C
Explanation: A) The client with sickle cell disease who is in a sickle cell crisis will likely have extreme pain. To aid in caring for this client, the nurse will administer prescribed analgesic medications around the clock.
B) To aid in caring for this client, the nurse will place the patient in a position of comfort.
C) The use of heat or cold packs is contraindicated in the sickle cell client.
D) To aid in caring for this client, the nurse will support the client's joints and extremities with pillows.
Page Ref: 148

Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with sickle cell disease.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

12) The nurse is reviewing risk factors for the development of sickle cell disease. Which race is at highest risk of inheriting sickle cell disease?
A) African American
B) Caucasian
C) Hispanic
D) Asian
Answer: A
Explanation: A) Sickle cell disease is most common among people of African descent. An estimated 1 in 13 African Americans carries one abnormal hemoglobin gene, and 1 in 365 African American newborns are born with two Hb S genes.
B) Sickle cell disease is not common in the Caucasian race.
C) Sickle cell disease is not common in Hispanics.
D) Sickle cell disease is not common in Asians.

Learning Outcome: 2.H. Analyze sickle cell disease as it relates to cellular regulation. Compare the risk factors for, and prevention of, sickle cell disease.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with sickle cell disease.

Exemplar 2.I Skin Cancer

1) During a routine physical examination of a client's lungs, the nurse notes a pink papule that is flat and erythematous with surface crusting on the client's upper chest. For which potential skin disorder will the nurse notify the healthcare provider of this finding?
A) Squamous cell carcinoma
B) Basal cell carcinoma
C) Actinic keratosis
D) Malignant melanoma
Answer: B
Explanation: A) Squamous cell carcinoma is most often found on parts that are exposed to the sun, such as the face and hands. It usually appears as a small, firm, red nodule that may bleed as it grows.
B) Superficial basal cell carcinoma is often found on the trunk, and it manifests as a papule or plaque that is flat, pink, erythematous, and crusting.
C) Actinic keratosis is a precancerous condition. The lesion appears as a shiny, rough macule.
D) Malignant melanoma manifests as black, brown, or multicolored nodules or plaques.
Page Ref: 152
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.I. Analyze skin cancer as it relates to cellular regulation. Identify the clinical manifestations of skin cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

2) The nurse is teaching a group of community members about preventing skin cancer. Which participant would be at the greatest risk for skin cancer?
A) A 25-year-old lifeguard at the community pool who wears sunscreen
B) A baby underneath a large beach umbrella
C) A 60-year-old farmer who wears a cap when working
D) A teenager who wears a ski outfit when skiing
Answer: C
Explanation: A) The lifeguard has lesser risk because of using sunscreen.
B) The baby is at less risk because of being under an umbrella.
C) The older adult client has had more years of living to increase the risk of skin cancer from exposure to the sun. In addition, the farmer wears a cap, but no mention is made of protectant sunscreens or long-sleeved shirts and pants.
D) The teenager has less risk because of wearing a ski outfit when skiing.
Page Ref: 153

Learning Outcome: 2.I. Analyze skin cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, skin cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

3) The nurse learns that a client with olive skin plans to "get a tan" when on vacation. Which statement indicates that additional teaching about sun exposure is needed?
A) "I don't need sunscreen because I have darker skin already."
B) "I will avoid the sun between the peak hours of 10 AM and 4 PM."
C) "I can still experience sun damage despite my darker skin tones."
D) "The melanocytes in my skin provide me with increased protection from the sun."
Answer: A
Explanation: A) While the melanocytes in darker skin offer increased protection, the risk for skin cancer remains and sunscreen should be worn.
B) Sun should be avoided between the peak hours of 10 AM and 4 PM.
C) While the melanocytes in darker skin offer increased protection, sun damage can still occur.
D) The melanocytes in darker skin do provide increased protection from the sun.
Page Ref: 154
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 2.I. Analyze skin cancer as it relates to cellular regulation. Compare the risk factors for, and prevention of, skin cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

4) The nurse is caring for an older adolescent client diagnosed with malignant melanoma. Which problems would be appropriate when planning this client's care? **Select all that apply.**
A) Anxiety
B) Impaired skin integrity
C) Imbalance in body fluids
D) Problems with peer group
E) Questions about missing school
Answer: A, B
Explanation: A) Any client will likely experience anxiety related to the diagnosis of skin cancer.
B) Any client will likely experience impaired skin integrity related to the diagnosis of skin cancer.
C) There is no evidence that the client has an imbalance in body fluids.
D) There is no evidence that the client has problems with the peer group.
E) There is no evidence that the client is going to miss school.

Learning Outcome: 2.I. Analyze skin cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with skin cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

5) During a community health fair, a young client asks about the safety of tanning beds. Which response should the nurse make?
A) "Using tanning beds without clothing contaminates skin and leads to infections."
B) "Tanning from ultraviolet light is safer than sunshine."
C) "Using sunscreen will prevent skin cancers, even in tanning beds."
D) "Exposure to ultraviolet light used in tanning beds can cause skin cancer."
Answer: D
Explanation: A) That using tanning beds without clothing causes infection may or may not be true, depending on the disinfecting methods used.
B) Direct sunlight and tanning beds both emit ultraviolet light that can cause skin damage that leads to skin cancer.
C) The use of sunscreen can reduce the risk of cancer but not prevent it, especially in tanning beds where the ultraviolet light is intensified.
D) Ultraviolet light exposure greatly increases risk of skin cancer, both basal cell and melanoma types.
Page Ref: 154
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

6) A client is scheduled to have a suspected cancerous lesion removed from the arm. When planning care for this client, which outcome would be a priority?
A) The client will make nutritional changes.
B) The client will experience minimal pain after healing.
C) The client will heal without signs of infection.
D) The client will not need to make lifestyle changes.
Answer: C
Explanation: A) Nutritional changes may or may not be needed; however, prevention of infection is the priority.
B) The client should not experience pain after healing.
C) Following removal of a skin lesion, the nurse directs care aimed at the prevention of infection while the skin heals.
D) The client will need to make lifestyle changes to prevent further occurrences of skin cancer.
Page Ref: 160
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 2.I. Analyze skin cancer as it relates to cellular regulation. Apply the nursing process in providing culturally competent care to an individual with skin cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

7) The nurse is reviewing the medical records for several clients who will be seen in the clinic today. According to the ABCDE rule, which client may require removal of the skin lesion?
A) A client with a lesion that is symmetrical with an irregular border, a single color, and diameter change from 4 mm to 5 mm
B) A client with a lesion that is symmetrical, with a smooth border, a single color, and diameter that has stayed the same
C) A client with a lesion that is asymmetrical with a regular border, two colors, and diameter change from 4 mm to 3 mm
D) A client with a lesion that is asymmetrical with an irregular border, two colors, and diameter change from 5 mm to 7 mm
Answer: D
Explanation: A) To meet all four criteria for removal of a lesion, the lesion will be asymmetrical, have irregular borders, show color change or more than one color, and have a diameter greater than 6 mm. This client's lesion does not meet the ABCDE criteria.
B) To meet all four criteria for removal of a lesion, the lesion will be asymmetrical, have irregular borders, show color change or more than one color, and have a diameter greater than 6 mm. This client's lesion is not considered a potential pathologic problem.
C) To meet all four criteria for removal of a lesion, the lesion will be asymmetrical, have irregular borders, show color change or more than one color, and have a diameter greater than 6 mm. This client's lesion does not require removal according to the ABCDE rule.
D) To meet all four criteria for removal of a lesion, the lesion will be asymmetrical, have irregular borders, show color change or more than one color, and have a diameter greater than 6 mm.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

8) A client diagnosed with skin cancer asks how it occurred when no time is spent tanning. Which response should the nurse make?
A) "Can you tell me more about your feelings?"
B) "This is unusual, as skin cancer normally only occurs in sunbathers."
C) "Sun exposure can happen as we carry out our daily activities."
D) "We frequently never find out why cancer strikes."
Answer: C
Explanation: A) The client is seeking information. The nurse does not need to ask the client to explain feelings.
B) Skin cancer can develop in anyone with any amount of sun exposure.
C) Sun exposure occurs as we carry out our daily activities, such as riding in the car, going in and out of buildings, and playing or working outside.
D) The number one risk for skin cancer is sun exposure.
Page Ref: 154
Cognitive Level: Applying

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

9) The nurse is caring for a client who has been diagnosed with a lentigo maligna. Which statement is inappropriate for the nurse to include in the client's teaching plan?
A) The lesion is also called Robertson freckle.
B) The lesion is a precursor to melanoma.
C) The lesion is a tan or black patch on the skin that looks like a freckle.
D) The lesion grows slowly, becoming mottled, dark, thick, and nodular.
Answer: A
Explanation: A) A lentigo maligna, also called a Hutchinson freckle, is a precursor to melanoma.
B) A lentigo maligna is a precursor to melanoma.
C) The lesion is a tan or black patch on the skin that looks like a freckle.
D) The lesion grows slowly, and becomes mottled, dark, thick, and nodular.

Learning Outcome: 2.I. Analyze skin cancer as it relates to cellular regulation. Describe the pathophysiology of skin cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

10) The nurse is using the ABCDE rule to evaluate a client's skin lesions. Which should the nurse evaluate for the letter "D"?
A) Diameter of lesion greater than 8 mm
B) Distance of lesion to an additional lesion
C) Diameter of lesion greater than 6 mm
D) Depth of lesion
Answer: C
Explanation: A) The ABCDE rule is used to assess suspicious lesions. The "D" is the diameter of the lesion greater than 6 mm.
B) The ABCDE rule is used to assess suspicious lesions. The D does not measure the distance of a lesion to another lesion.
C) The ABCDE rule is used to assess suspicious lesions, The "D" is the diameter of the lesion is greater than 6 mm.
D) The ABCDE rule is used to assess suspicious lesions. The "D" does not measure the depth of the lesion.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 2.I. Analyze skin cancer as it relates to cellular regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with skin cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

11) The nurse is planning a teaching tool about skin cancer. Which cause of skin cancer should the nurse identify as being the most common?
A) Exposure to melanin
B) UV radiation from sunlight
C) Damage from chemicals
D) Inflammation from psoriasis
Answer: B
Explanation: A) Melanin is a naturally-occurring skin pigment. Exposure to melanin itself does not cause skin cancer.
B) Exposure to UV radiation from sunlight is a major cause of skin cancer. Tanning beds are another dangerous form of UV exposure.
C) Although damage from chemicals may lead to skin cancer, it is not a common cause of skin cancer.
D) Inflammation from psoriasis is not directly linked to skin cancer.
Page Ref: 153
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Planning
Learning Outcome: 2.I. Analyze skin cancer as it relates to cellular regulation. Describe the etiology of skin cancer.
MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

12) An older client is diagnosed with skin cancer. Which assessment should the nurse complete before implementing a topical medication?

A) Coagulation disorders
B) Dementia
C) Cardiovascular disease
D) Diabetes

Answer: B

Explanation: A) Coagulation disorders should be considered before planning surgical interventions for older clients with skin cancer.

B) For older clients with skin cancer, the use of topical treatments may be an option, but the presence and levels of arthritis and dementia need to be considered prior to prescribing this treatment.

C) Cardiovascular disease should be considered before planning surgical interventions for older clients with skin cancer.

D) Diabetes should be considered before planning surgical interventions for older clients with skin cancer.

Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 2.I. Analyze skin cancer as it relates to cellular regulation. Differentiate considerations for care of patients with skin cancer across the lifespan.

MNL LO: Demonstrate understanding of the concept of cellular regulation in the care of a patient with skin cancer.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e (Pearson)
Module 3 Comfort

The Concept of Comfort

1) The nurse assesses a client's level of comfort. In which way will the nurse categorize comfort when the client relates having positive family and social relationships?
A) Transcendence
B) Environmental
C) Psychospiritual
D) Sociocultural
Answer: D
Explanation: A) Transcendence is not a context of holistic human experience.
B) Environmental comfort is related to the external surroundings.
C) Psychospiritual comfort is related to the individual awareness of oneself and one's relationship to a higher being.
D) Sociocultural comfort is related to family and social relationships.
Page Ref: 167
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 3.1. Analyze the physiology of comfort in the body.
MNL LO: Analyze the concept of comfort and its application to nursing care.

2) The nurse is assessing the comfort level of a client with a chronic illness. Which statement indicates that the client is experiencing fatigue?

A) "I feel like I have no energy today."
B) "I don't feel any physical pain today."
C) "I was able to sleep uninterrupted last night."
D) "I am so glad that playing cards takes my mind off my worries."

Answer: A

Explanation: A) Fatigue is a lack of energy and motivation. A fatigued client is unable to focus on healing and lacks the ability to cope in stressful situations.
B) The absence of pain would promote comfort.
C) Adequate sleep will promote comfort.
D) Diversional activities will promote comfort.

Page Ref: 169
Cognitive Level: Analyzing
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.1. Learning Outcome: 3.2. Differentiate alterations in comfort.
MNL LO: Analyze the concept of comfort and its application to nursing care.

3) The nurse is concerned that a client is at risk for discomfort. Which assessment finding caused the nurse to have this concern? **Select all that apply.**
A) Poor diet
B) Drinks beer daily
C) Smokes cigarettes
D) Works 8-hour days
E) Sleeps 4 hours a night
Answer: A, B, C, E
Explanation: A) Lifestyle habits can predispose individuals to chronic health alterations and increase the risk for discomfort. A poor diet is a risk factor.
B) Excessive alcohol intake is a risk factor for chromic health alterations and increased risk for discomfort.
C) Cigarette smoking is a risk factor for chronic health alterations and increased risk for discomfort.
D) Working an 8-hour day is not identified as a risk factor for chronic health alterations or discomfort.
E) Poor sleeping habits is a risk factor for chronic health alterations and increased risk for discomfort.

Learning Outcome: 3.4. Explain the promotion of comfort.
MNL LO: Analyze the concept of comfort and its application to nursing care.

WWW.TBSM.NG

4) The nurse is preparing to assess a 1-year-old client for signs of discomfort. When conducting the assessment, which action by the nurse is the most appropriate?
A) Asking the client to rate the pain on a scale of 0-10 during the assessment process
B) Asking the parent to hold the client in the lap during the assessment process
C) Reading a book to the client during the assessment process
D) Recommending that the parent leave the room during the assessment process
Answer: B
Explanation: A) A numeric pain scale is not appropriate until the client is older.
B) Children may be fearful of physical assessment. To promote comfort, allow the child to sit on the parent's or guardian's lap during the assessment process.
C) Reading a book during the assessment process is not age appropriate.
D) Ask the parent or guardian to stay in the room during the assessment.

Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 3.5. Differentiate common assessment procedures and tests used to examine comfort.
MNL LO: Analyze the concept of comfort and its application to nursing care.

5) The surgical wound of a pediatric client is red with purulent drainage and is causing discomfort for the client. Which diagnostic test will determine if the discomfort of the wound is caused by an infection?

A) White blood cell count
B) Hematocrit level
C) Urine analysis
D) X-rays of the site

Answer: A

Explanation: A) A white blood cell count will determine if the discomfort is being caused by an infection.

B) Hematocrit measurement may identify iron deficiency anemia.

C) Urine analysis may indicate illness or malnutrition.

D) An x-ray is useful for determining the existence of physical injuries, not the presence of infection.

6) An 18-month-old toddler begins to cry when placed on the examination table. Which action by the nurse is the most appropriate?
A) Allow the toddler to sit on the parent's lap and begin the assessment.
B) Allow the toddler to stand on the floor until the crying stops.
C) Ask another nurse in the office to hold the toddler because the parent is not able to control the toddler's behavior.
D) Instruct the parent to hold the toddler down tightly to complete the examination.
Answer: A
Explanation: A) Toddlers are most comfortable when sitting with the parents.
B) Allowing the toddler to stand on the floor is inappropriate.
C) A nurse can assist if the parent is unable to hold the child during the assessment.
D) Holding the toddler down tightly is inappropriate.
Page Ref: 177
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.8. Differentiate considerations related to the assessment and care of patients with alterations in comfort throughout the lifespan.
MNL LO: Analyze the concept of comfort and its application to nursing care.

7) A client arrives for a routine physical examination. Which behavior indicates to the nurse that the client's level of comfort should be assessed? **Select all that apply.**

A) Ambulates slowly
B) Sits with an erect posture
C) Holds arms over the abdomen
D) Grimaces when changing positions
E) Spontaneously responds to questions
Answer: A, C, D
Explanation: A) The client should be observed during every encounter. Altered mobility is an obvious sign of discomfort.
B) Sitting with an erect posture does not indicate discomfort.
C) Guarding is an obvious sign of discomfort.
D) Grimacing when changing positions is an obvious sign of discomfort.
E) Spontaneously responding to questions does not indicate discomfort.
Page Ref: 173
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Assessment
Learning Outcome: 3.5. Differentiate common assessment procedures and tests used to examine comfort.
MNL LO: Analyze the concept of comfort and its application to nursing care.

8) The nurse is designing a teaching plan for community members on ways to prevent chronic pain. Which information should the nurse include in this teaching plan? **Select all that apply.**
A) Eating a healthy diet
B) Obtaining adequate sleep
C) Avoiding illicit drug use
D) Limiting smoking to only before bedtime
E) Avoiding repetitive movements
Answer: A, B, C, E
Explanation: A) Lifestyle habits that predispose individuals to chronic health alterations increase an individual's risk for experiencing discomfort. Eating a healthy diet can prevent the development of chronic diseases that lead to symptoms of discomfort.
B) Lifestyle habits that predispose individuals to chronic health alterations increase an individual's risk for experiencing discomfort. Obtaining adequate sleep can prevent the development of chronic diseases that lead to symptoms of discomfort.
C) Lifestyle habits that predispose individuals to chronic health alterations increase an individual's risk for experiencing discomfort. Using illicit drugs can cause emotional and physical withdrawal symptoms when the drug is no longer used. It is wise to not engage in illicit drug use to prevent the onset of discomfort.
D) Lifestyle habits that predispose individuals to chronic health alterations increase an individual's risk for experiencing discomfort. Smoking can cause emotional and physical withdrawal symptoms when the drug is no longer used. It is wise to not engage in smoking to prevent the onset of discomfort.
E) Lifestyle habits that predispose individuals to chronic health alterations increase an individual's risk for experiencing discomfort. Repetitive movements can increase the risk for injury and fatigue, leading to discomfort.

Page Ref: 172
Cognitive Level: Synthesizing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 3.4. Explain the promotion of comfort.
MNL LO: Analyze the concept of comfort and its application to nursing care.

9) The nurse is creating a teaching tool about comfort. Which client will the nurse identify that is most likely to reject attempts at comfort?
A) An infant crying
B) A school-age child with abdominal pain who is anxious about a procedure
C) An adolescent with a sleep disorder who doesn't want parental attention
D) An older adult with end-stage renal disease
Answer: C
Explanation: A) An infant crying is verbalizing the need for comfort.
B) A school-age child anxious about a medical procedure craves reassurance.
C) Adolescents may respond to treatment and comfort better if they are treated as adults rather than as children. Some adolescents may reject any offer of comfort, and an adolescent with a sleep disorder who does not want parental attention is probably irritable from the condition and may immediately reject attempts at comfort, at least at first.
D) An older adult with a terminal illness likely will welcome comfort measures even if the client has accepted the likelihood of death.

Cognitive Level: Analyzing
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.1 Engage with the individual in establishing a caring relationship. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Planning
Learning Outcome: 3.8. Differentiate considerations related to the assessment and care of patients with alterations in comfort throughout the lifespan.
MNL LO: Analyze the concept of comfort and its application to nursing care.

10) During an assessment, a client reports feeling fatigued. Which observation should the nurse use to validate the client's statement? **Select all that apply.**
A) Motivated
B) Confusion
C) Irritability
D) Difficulty sleeping
E) Activity intolerance
Answer: B, C, D, E
Explanation: A) Motivation is not a manifestation of fatigue.
B) A manifestation of fatigue is decreased cognition.
C) Irritability is a manifestation of fatigue.
D) Sleep deprivation is a manifestation of fatigue.
E) Activity intolerance is a manifestation of fatigue.

11) The nurse is caring for a client who begins to vomit. Which lifespan consideration will the nurse take into consideration when assessing the reason for the client's emesis? **Select all that apply.**
A) Signs of discomfort
B) Current medications
C) Known drug allergies
D) Environmental stimuli
E) Current disease processes
Answer: B, C, E
Explanation: A) Signs of discomfort would be taken into consideration if the client reports severe pain or disrupted sleep patterns.
B) Current medications should be taken into consideration if the client displays vomiting.
C) Known drug allergies should be taken into consideration if the client vomits.
D) Environmental stimuli should be taken into consideration if the client is experiencing anxiety.
E) Current disease processes should be taken into consideration if the client vomits.

Learning Outcome: 3.7. Summarize collaborative therapies used by interprofessional teams for clients with alterations in comfort.
MNL LO: Analyze the concept of comfort and its application to nursing care.

12) The nurse is assessing a client's level of comfort. Which finding indicates that the client has psychospiritual comfort?
A) Balance of physical processes
B) Connection to a higher power
C) Connection to others
D) Equilibrium with external circumstances
Answer: B
Explanation: A) Equilibrium with external circumstances is related to the environmental context.
B) Connection to a higher power is related to the psychospiritual context.
C) The sociocultural context of holistic human experience is related to connection with others in society.
D) Equilibrium with external circumstances is related to the environmental context.

Learning Outcome: 3.3. Outline the relationship between comfort and other concepts.
MNL LO: Analyze the concept of comfort and its application to nursing care.

Exemplar 3.A Acute and Chronic Pain

1) The nurse is asked to explain chronic pain. Which response will the nurse make?
A) "Pain that precedes injury."
B) "Pain that follows injury and ends when healing is complete."
C) "Pain that is felt during injury and immediately after."
D) "Pain that outlasts the healing process."
Answer: D
Explanation: A) Chronic pain does not precede injury.
B) Chronic pain does not subside immediately after injury, and it may not be related to an injury.
C) Chronic pain is pain that lasts beyond the expected time of healing, usually for at least 6 months; it does not always have a known cause. Pain can range from mild to severe, and autonomic responses decrease over time as the body adapts to the persistent pain impulses. Chronic pain does not end when healing is complete.
D) Chronic pain is pain that lasts beyond the expected time of healing, usually for at least 6 months; it does not always have a known cause. Pain can range from mild to severe, and autonomic responses decrease over time as the body adapts to the persistent pain impulses.
Page Ref: 182

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.A. Analyze acute and chronic pain as they relate to comfort. Describe the etiology of acute and chronic pain.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with acute and chronic pain.

2) The nurse is reviewing the ceiling effect that can occur with analgesics. Which should the nurse identify as the relationship between a full opioid agonist and the ceiling effect?
A) A full opioid agonist produces few withdrawal symptoms when the drug's effects plateau and the client begins easing off the drug.
B) A client may use a full opioid agonist as much or as little as necessary to control chronic pain with no ill effects.
C) Side effects may limit a full opioid agonist's use but not a plateau in the beneficial effects it produces.
D) At some point, a full opioid agonist's side effects cease to increase in potency, but the pain-relieving effect continues to increase.
Answer: C
Explanation: A) Clients who develop tolerance to opioids are likely to experience withdrawal symptoms.
B) They should be used for clients in severe pain or when other medications have failed to control pain.
C) Full opioid agonists do not have a ceiling effect. Therefore, full opioid agonists can be given in increasing doses until pain is relieved or side effects become intolerable.
D) Full agonists are known to produce euphoria, respiratory depression, and tolerance. Euphoria may help the client feel more comfortable even with uncontrolled pain, but respiratory depression may be a life-threatening side effect.
Page Ref: 192
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 3.A. Analyze acute and chronic pain as they relate to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with acute and chronic pain.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with acute and chronic pain.

3) The nurse reviews information about the use of nonopioid pain medication for chronic back pain. Which client statement indicates the need for further instruction?

A) "Nonopioid pain medications can have serious side effects I need to consider and watch for carefully."

B) "I should not take a higher than recommended dose because the beneficial effect isn't likely to be higher with a higher dose."

C) "I may use these medications for as long as I think they are necessary."

D) "I may use both opioid and nonopioid medications together, especially to relieve severe pain."

Answer: C

Explanation: A) NSAIDs can produce gastrointestinal (GI) toxicity and prolong bleeding times, and acetaminophen can produce liver and kidney toxicity.

B) Nonopioids have a ceiling effect, so taking a higher dose will not produce a greater analgesic effect.

C) Over-the-counter (OTC) nonopioids are associated with severe side effects, especially when taken long term.

D) While nonopioids are rarely effective alone for severe pain, they may produce a synergistic effect to relieve pain when combined with an opioid.

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 3.A. Analyze acute and chronic pain as they relate to comfort. Apply the nursing process in providing culturally competent care to an individual with acute and chronic pain.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with acute and chronic pain.

4) A toddler being prepared for a lumbar puncture begins to cry when carried into the treatment room by the mother. Which client problem will the nurse use to guide this child's care?
A) Lack of knowledge about pain
B) Anxiety
C) Fear
D) Stress overload
Answer: B
Explanation: A) This child is not old enough to understand the need for a lumbar puncture.
B) The child associates the treatment room with a painful procedure, and the reaction to entering the treatment room is based on anticipation of repeat discomfort.
C) The child's fear is related not to the unfamiliar environment but to the anticipated pain associated with the treatment room from having undergone painful procedures there.
D) The child's behavior is appropriate for coping in a child of this age.
Page Ref: 202
Cognitive Level: Analyzing
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 3.A. Analyze acute and chronic pain as they relate to comfort. Differentiate care of patients with acute and chronic pain across the lifespan.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with acute and chronic pain.

5) The nurse is creating a pain management plan using the three-step approach for a client with intractable pain. Which interventions should the nurse include in this plan? **Select all that apply.**
A) Administer a nonopioid analgesic first.
B) Administer an opioid analgesic first.
C) Administer a nonopioid with an opioid second.
D) Administer an opioid analgesic last.
E) Administer analgesics upon client request.
Answer: A, C, D
Explanation: A) The first step in the three-step approach to pain management involves administering a nonopioid drug first.
B) An opioid analgesic is not the first step in the three-step approach to pain management.
C) If pain is not adequately controlled with a mild intervention, clients should advance to step 2 and receive a mild opioid in combination with the same or a new nonopioid drug.
D) If the client is still experiencing pain after receiving the nonopioid and the mild opioid, the mild opioid should be replaced with a stronger opioid in step 3.
E) Pain-relieving drugs should be given "by the clock" (every 3-6 hours) rather than on demand to maintain freedom from pain.

6) The nurse is concerned that a client is at risk for injury because of pain. Which statement will the nurse use to explain this risk?

A) Risk for injury is an external risk factor for pain.

B) It is difficult to predict what might pose a risk for injury.

C) Risk for injury can be increased by living a healthy lifestyle.

D) Precautions against risk for injury are rarely successful in preventing injury.

Answer: A

Explanation: A) External risk factors for pain, such as the risk for injury, can be decreased by safety precautions such as wearing a seat belt or helmet.

B) It is not difficult to anticipate what might pose a risk for injury.

C) Internal risk factors for pain, such as the risk of developing a chronic disease, can be decreased by living a healthy lifestyle.

D) The risk for injury can be decreased by safety precautions such as wearing a seat belt or helmet.

7) An older client with uterine cancer and chronic pain from arthritis is prescribed long-acting narcotic pain medication every 4 hours. Which action should the nurse take when providing the client with the medication?
A) Administer the medication if the client requests it.
B) Administer the medication every 4 hours around the clock.
C) Consult the provider to order intravenous pain medication.
D) Administer the medication sparingly to avoid narcotic addiction.
Answer: B
Explanation: A) The client shouldn't need to request the medication; the medication should be administered around the clock as prescribed.
B) Administer analgesics as prescribed. Analgesics should be administered around the clock or by self-administration with a patient-controlled analgesic (PCA) pump to keep the pain from becoming severe. In this case, the nurse should follow the prescribed administration plan of every 4 hours around the clock.
C) The nurse should administer the medication orally as prescribed rather than consult the provider for intravenous medication.
D) The medication should be administered around the clock as prescribed rather than sparingly.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with acute and chronic pain.

8) A preschool-age client needs intravenous medication now and there is no time to use a local anesthetic to reduce the pain from inserting the catheter. Which complementary approach should the nurse use?

A) Simulate the procedure
B) Swaddle the child
C) Guided imagery
D) Distraction using bubbles

Answer: D

Explanation: A) Simulating the procedure would be appropriate for a school-age child.
B) Swaddling would be appropriate for an infant.
C) Guided imagery would be appropriate for a school-age child.
D) Playing games such as blowing bubbles would be appropriate to distract a preschool-age child.

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 3.A. Analyze acute and chronic pain as they relate to comfort. Differentiate care of patients with acute and chronic pain across the lifespan.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with acute and chronic pain.

9) The nurse is creating a teaching tool about the pathophysiology of pain. Which body system should the nurse identify as the trigger for pain?
A) Central nervous system
B) Peripheral nervous system
C) Musculoskeletal system
D) Cardiovascular system
Answer: B
Explanation: A) Pain is not triggered by the central nervous system.
B) Pain is triggered by the peripheral nervous system, which lies outside the brain and spinal cord of the central nervous system.
C) Pain is not triggered by the musculoskeletal system.
D) Pain is not triggered by the cardiovascular system.
Page Ref: 180
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.A. Analyze acute and chronic pain as they relate to comfort. Describe the pathophysiology of acute and chronic pain.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with acute and chronic pain.

10) The nurse is caring for a client who has experienced pain "for years." Which statement describes how the body adapts to pain?
A) The worse pain becomes, the more obvious it is.
B) Once the body adapts to pain, its detrimental effects cease.
C) The observation of pain's effects may become more difficult.
D) The body's sympathetic response increases.
Answer: C
Explanation: A) The sympathetic response returns to baseline levels unless the client experiences breakthrough pain, and some visible signs of pain, such as crying, cease.
B) Pain fibers may become sensitized so that the intensity and perception of pain increase over time.
C) As the body adapts to pain, visible and physiological symptoms of pain may be harder to detect.
D) The sympathetic response returns to baseline levels.
Page Ref: 184
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Learning Outcome: 3.A. Analyze acute and chronic pain as they relate to comfort. Identify the clinical manifestations of acute and chronic pain.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with acute and chronic pain.

11) The nurse is preparing a presentation about pain for a community health fair. Which statement will the nurse use to describe all pain?
A) Pain is the result of tissue damage.
B) Pain's effects are primarily physiological, not mental or emotional.
C) Pain can be localized to a particular area of the body.
D) Pain's effects can be verbalized.
Answer: D
Explanation: A) Pain may be the result of tissue damage or a warning of the potential for damage.
B) Pain is both a physical and an emotional experience.
C) Pain may not be localized in its effects.
D) Pain can be described by the client, and so all pain can be verbalized.
Page Ref: 179

Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 3.A. Analyze acute and chronic pain as they relate to comfort. Describe the pathophysiology of acute and chronic pain.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with acute and chronic pain.

Exemplar 3.B End-of-Life Care

1) A client with a terminal illness is showing signs of imminent death. Which change should the nurse most expect the client to exhibit first?
A) Decreased blood pressure
B) Blurry vision
C) Confusion
D) Irregular pulse rate
Answer: A
Explanation: A) Low blood pressure, or hypotension, occurs as a client's body begins to near death.
B) Blurry vision is not the change that the client will exhibit first.
C) Confusion is not the first change that will occur first.
D) An irregular pulse rate may be the result of a change in blood pressure when death is imminent.
Page Ref: 207
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 3.B. Analyze end-of-life care as it relates to comfort. Identify the clinical manifestations seen in patients at the end of life.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

2) The family of a competent older adult client plans to contest the client's living will that expresses the desire to avoid resuscitation and life support measures. Which action should the nurse take?

A) Place the document on the chart.

B) Contact the Social Services department.

C) Explain to the client that the conflict could invalidate the document.

D) Notify the hospital attorney.

Answer: A

Explanation: A) The client is competent. The wishes of the client must take priority. The document should first be placed on the chart and the provider notified.

B) If there are concerns about the authenticity of the document, the Social Services department or the unit supervisor will need to be contacted.

C) A lack of support by the family, or a plan to contest, does not invalidate the document legally.

D) There is no need to notify the hospital attorney at this time.

Client Need/Sub: Safe and Effective Care Environment: Management of Care

Standards: QSEN Competencies: I.A.7. Explore ethical and legal implications of patient-centered care. | AACN Domains and Competencies: 2.1 Engage with the individual in establishing a caring relationship. | NLN Competencies: Relationship Centered Care: Threats to the integrity of relationships, and the potential for conflict and abuse. | Nursing Process: Implementation

Learning Outcome: 3.B. Analyze end-of-life care as it relates to comfort. Describe legal and ethical issues that inform care of patients at the end of life.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

3) The family of a client who has suffered a massive cerebral hemorrhage and is not expected to survive informs the nurse that the client is Catholic. Which action should the nurse take?
A) Find a Catholic nurse to continue care for the client.
B) Contact a priest and ask what must be done for the client.
C) Assume the client's desires based on the nurse's understanding of the Catholic faith.
D) Ask the client or the client's family what they want in terms of religious rituals.
Answer: D
Explanation: A) The nurse doesn't need to find a Catholic nurse to continue care.
B) Contacting a priest may be necessary for the client to receive the Anointing of the Sick, but the nurse should follow the client's or family's request in this matter.
C) The nurse should not assume what the client wants in this regard.
D) Cultural and religious beliefs and traditions are often of paramount importance for end-of-life clients and their families. Nurses should work to facilitate requests to every extent possible.
Page Ref: 213
Cognitive Level: Analyzing
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.1 Engage with the individual in establishing a caring relationship. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 3.B. Analyze end-of-life care as it relates to comfort. Apply the nursing process in providing culturally competent care to an individual at the end of life.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

W W . T B S M W S

4) The family of a terminally ill client have been tearful and sad since the diagnosis was given. Which problem should the nurse identify as a priority for the family?
A) Grieving
B) Feelings of hopelessness
C) Inadequate family coping skills
D) Caregiver burden
Answer: A
Explanation: A) Grieving prior to the actual loss is termed anticipatory grieving.
B) There are no assessment findings that indicate feelings of hopelessness.
C) There are no assessment findings that indicate inadequate family coping.
D) There is no indication that the family is exhibiting caregiver burden.
Page Ref: 214
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs.NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 3.B. Analyze end-of-life care as it relates to comfort. Summarize the needs of patients at the end of life.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

5) An older adult client with a terminal illness has a living will and requests comfort measures only. Which action will the nurse take when the client reports significant pain, dyspnea, and cold and mottled skin?

A) Ask the family what they want to be done for the client.

B) Withhold all care until the client dies.

C) Contact the provider for orders to control the client's breathing.

D) Provide the client with pain medication as ordered.

Answer: D

Explanation: A) Asking the family what they want to be done is inappropriate when a client has written a living will.

B) Clients with a CMO order should receive effective pain and symptom management, spiritual care, food and fluids as the client is able, and hygiene care.

C) Contacting the provider to intervene to control respiration is considered adding extraordinary measures and is inappropriate, as is going against the client's written wishes when a living will is present and in force.

D) "Comfort measures only" indicates that the client does not want extraordinary measures to sustain life. This does not mean that nursing care ceases but that nursing care to provide client comfort is intensified and maintained through the end stages of the client's life. Clients with a CMO order should receive effective pain and symptom management, spiritual care, food and fluids as the client is able, and hygiene care.

Page Ref: 211

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: I.A.7. Explore ethical and legal implications of patient-centered care. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 3.B. Analyze end-of-life care as it relates to comfort. Describe legal and ethical issues that inform care of patients at the end of life.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

6) The nurse is caring for a dying child. Which nursing action supports the primary goal for a dying child?
A) Keep the child entertained so she does not think about dying.
B) Ensure that a good relationship is maintained with the family.
C) Administer pain medication as ordered.
D) Maintain a busy schedule for child and family members.
Answer: C
Explanation: A) Keeping the child entertained is good, but the client needs to voice feelings about death and dying.
B) Maintaining a good relationship is important but not a major goal for the child's care.
C) Children with life-limiting conditions should receive palliative care in much the same way it is provided to adults. The major goal for the dying child is to promote comfort and keep the child pain-free by providing analgesia to promote optimal pain relief.
D) A dying child does not have the energy to maintain a busy schedule.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

W W . T B S M . W S

7) The parents of a child with terminal cancer do not want the child to be told of the prognosis. Which action should the nurse take if the child asks about dying?
A) Suggest a meeting with the healthcare team and the parents.
B) If the child asks about death, offer to bring in the child life therapist to help explain the situation.
C) Tell the child they are dying if the child asks and offer to stay with them.
D) Prepare to ignore the child's question if the child asks it and change the subject.
Answer: A
Explanation: A) Offering to set up a meeting with the healthcare team to discuss the parents' fears and concerns about telling their child the truth is the best action by the nurse.
B) The nurse should not simply pass the issue off to a therapist.
C) Telling the child about the prognosis is going against the parents' wishes.
D) Avoiding the subject is not an option.
Page Ref: 211
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 3.B. Analyze end-of-life care as it relates to comfort. Differentiate considerations for the care of children and adolescents who are at the end of life.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

8) Parents of an older school-age child with traumatic injuries observe noneffective efforts at resuscitation. Which communication strategy should the nurse use in this situation?
A) Ask the parents whether they would like resuscitative efforts to be continued at this point.
B) Ask the parents to stand at the foot of the cart to watch.
C) Inform the parents that resuscitative efforts have not been effective and are not beneficial to the child.
D) Ask the parents to leave until the child has stabilized.
Answer: C
Explanation: A) Asking the parents if they want resuscitation to continue would not be effective.
B) Asking the parents to watch the resuscitation would be painful for them and should not be done.
C) Care must be used in how the parents are asked to withdraw therapies. An effective communication strategy is to inform the parents that an intervention was initiated to give the child the best chance of recovery, but it has not been effective and is not beneficial to the child.
D) The parents should not be asked to leave; however, they should be asked if they want to stay and the nurse should answer any questions they may have.
Page Ref: 211
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.8. Describe the limits and boundaries of therapeutic patient-centered care. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 3.B. Analyze end-of-life care as it relates to comfort. Differentiate considerations for the care of children and adolescents who are at the end of life.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

9) The spouse of a client with end-stage pulmonary disease thinks that hospice is only for people with cancer, it is expensive, and that there will be people in the home at all times. Which responses should the nurse make? **Select all that apply.**

A) Inform the spouse that a diagnosis of cancer is not required for hospice care.

B) Inform the spouse that hospice care is very expensive.

C) Tell the spouse that hospice care is intended to ease the burden of primary caregivers, not add to it by being in the way.

D) Tell the spouse that the client is not eligible for hospice care.

E) Inform the spouse that all hospice programs are provided 24/7 in long-term care facilities.

Answer: A, C

Explanation: A) In addition to clients who are diagnosed with cancer, a variety of clients qualify for hospice care.

B) In many cases, hospice is provided by the individual's health insurance or Medicare policy.

C) Hospice care supports the involvement of family in clients' care and is available to help ease the burden of primary caregivers.

D) To be eligible for hospice care, clients need to be diagnosed by a physician as having 6 months or less to live.

E) Hospice care can take place in the client's home or in hospice centers, hospitals, nursing homes, and other long-term care facilities.

Page Ref: 210

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 3.B. Analyze end-of-life care as it relates to comfort. Contrast palliative and hospice care.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

10) An adolescent client with terminal cancer does not want any more treatment, even though the parents want the client to participate in a study trial that involves aggressive chemotherapy. Which action should the nurse take?
A) Tell the client that the parent's decision is to be followed.
B) Tell the client that a 16-year-old can make independent decisions.
C) Request that the parents and client meet with the healthcare team to discuss options and the implications of various choices.
D) Tell the client not to worry.
Answer: C
Explanation: A) The parent's decision does not need to be followed.
B) The Patient Self-Determination Act of 1990 limits the legal rights of individuals younger than 18 to make their own healthcare decisions.
C) If the adolescent states a desire to withdraw from, or refuse, treatment, the parents and healthcare team should discuss the reasons for the decision and help the client understand the implications of the client's decision and any treatment alternatives that may influence the choice.
D) Telling the client not to worry does not address the problem.
Page Ref: 211

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

11) A client with a terminal illness is receiving artificial nutrition and hydration. Which action will the nurse take to relieve the client's report of a dry mouth?
A) Mouth care
B) Mechanical ventilation
C) Massage extremities
D) Safety measures
Answer: A
Explanation: A) A client with diminished muscle control might have decreased food and fluid intake resulting from difficulty swallowing and decreased gastrointestinal activity. In addition to providing nutrients and hydration to this client artificially, other clinical therapies might be to provide regular oral care and to provide hygiene care as needed.
B) Mechanical ventilation is therapy for a respiratory problem.
C) Massage would help with a problem with circulation.
D) Safety measures would not help reduce the sensation of a dry mouth.
Page Ref: 212

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

12) The nurse is caring for a client who is nearing end of life. For which reason should the nurse communicate changes in the client's condition that would warrant a change in the care plan?
A) Nurses typically are responsible for definitively diagnosing patient conditions.
B) Nurses are the healthcare providers who tend to have the greatest amount of contact with clients at the end of life.
C) Clients typically do not prefer to talk to physicians about problems.
D) It is legally mandated that nurses are solely responsible for communicating this information.
Answer: B
Explanation: A) Nurses do not definitively diagnose a client's condition.
B) Collaboration between healthcare providers is essential to providing quality care at the end of life. Nurses interact with clients most frequently, so they are responsible for communicating any changes in the client's condition that would warrant a change in the care plan.
C) Clients often talk to physicians about problems.
D) Nurses are not the only legally mandated people who may communicate changes in a client's condition.
Page Ref: 211

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

13) The nurse is preparing a teaching tool about care at end of life. Which statement indicates a barrier to pain control?
A) Pain cannot be managed
B) Pain can be predicted
C) Pain is inevitable
D) Pain is acute
Answer: C
Explanation: A) Pain can be managed with appropriate pharmacologic and nonpharmacologic measures.
B) Pain cannot be predicted.
C) A barrier from the client's perspective about pain relief is that pain is inevitable and nothing can be done about it.
D) Pain at end of life can be either acute or chronic.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient requiring end-of-life care.

Exemplar 3.C Fatigue

1) A client who feels tired after sleeping reports family members complain about the constant snoring. Which condition should the nurse suspect as being the cause of this client's fatigue?
A) Insomnia
B) Depression
C) Thyroid disorder
D) Sleep apnea
Answer: D
Explanation: A) Insomnia is the absence of sleep.
B) There is not enough information to determine if the client is depressed.
C) There is not enough information to determine if the client has a thyroid disorder.
D) The client is snoring at home, which could indicate obstructive sleep apnea.
Page Ref: 216
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of fatigue.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

2) The nurse is asked for information about lifestyle situations that might contribute to chronic fatigue. Which examples might the nurse identify in response to this request? **Select all that apply.**

A) Thyroid problems
B) Chronic back pain
C) Marijuana use
D) Vigorous exercise three times a week
E) Swimming after a meal

Answer: A, B, C

Explanation: A) Some risk factors for fatigue are hyper- or hypothyroidism.
B) Persistent pain is a risk factor for fatigue.
C) Use of illicit drugs is a risk factor for fatigue.
D) Vigorous exercise will energize, not produce fatigue.
E) Fatigue is a symptom that needs investigating. Some risk factors for fatigue are hyper- or hypothyroidism, use of illicit drugs such as marijuana, and chronic pain. Synthroid use indicates hypothyroidism. Swimming will energize, not produce fatigue.

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of fatigue.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

3) An adolescent client experiencing fatigue reports getting up each day at 6 AM, attending band classes, playing sports for 2 hours after school each day, and then going home to do homework. Which question will the nurse make a priority?
A) "Do you think you are involved in too many activities?"
B) "Do you consume foods high in iron such as red meat and green, leafy vegetables?"
C) "How many hours of sleep do you get each night?"
D) "Have you considered talking with your teachers about decreasing your homework?"
Answer: C
Explanation: A) Asking if the client thinks the number of activities should be reduced does not directly address the number of hours of sleep the client is getting.
B) The history should focus on sleep patterns, not diet.
C) The data in this scenario reveal very little time for sleep; therefore, the history should focus on sleep patterns.
D) Asking if the client thinks the amount of homework should be reduced does not directly address the number of hours of sleep the client is getting.
Page Ref: 219
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Apply the nursing process in providing culturally competent care to an individual with fatigue.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

4) The nurse identifies fatigue as being a problem for a school-age child who gets 10 hours of sleep each night. Which intervention should the nurse add to the client's plan of care?
A) Recommend a sleep study.
B) Recommend a healthy and well-balanced diet with adequate water intake.
C) Recommend that the client's parents keep a journal of activities and sleep patterns.
D) Recommend cognitive-behavioral therapy.
Answer: B
Explanation: A) A sleep study is not indicated for a client who is getting adequate sleep.
B) If the client appears to be getting an adequate amount of sleep each night, then ensuring the client is eating a proper diet would be the first response to fatigue.
C) Keeping a journal of the client's behavior is a step that would follow dietary recommendations if those don't address the fatigue.
D) Cognitive-behavioral therapy is an approach that would follow other, less intensive approaches should they fail to address the fatigue.
Page Ref: 220
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Differentiate considerations for care of patients with fatigue across the lifespan.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

5) A new mother reports being fatigued because the baby is not sleeping well. Which suggestion should the nurse make that would help decrease this client's fatigue?
A) Advise the client to alternate night feedings with the baby's father to allow each parent to rest.
B) Suggest that the client ask the neighbors to babysit one night a week.
C) Ask the physician for medication to restore energy.
D) Increase exercise time each week to promote energy.
Answer: A
Explanation: A) Getting up with the newborn causes fatigue over time. If the parents take turns getting up, each parent will get a full night of rest every other day, which should help with fatigue.
B) Asking someone to babysit once a week will not significantly increase rest time and depends on the sustained commitment of neighbors to giving up a night out of every week.
C) Medications to restore energy are not appropriate in this case.
D) These parents need sleep, and increasing exercise is not a long-term solution for sleep deprivation.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

6) A client with fatigue is requesting medication for the condition. Which factor should the nurse identify that determines the effectiveness of pharmacologic therapy for fatigue?
A) The client's attitude toward taking medication
B) The length of time the client has been fatigued
C) The appropriateness to the client's condition
D) The client's commitment to complementary therapies
Answer: C
Explanation: A) The client certainly must be willing to take medication, but if the medication isn't appropriate in the first place, the client's willingness doesn't matter.
B) The length of the client's condition isn't a factor.
C) Pharmacologic therapy depends on the cause of fatigue. To be effective, the pharmacologic therapy must be tailored to the client's specific condition.
D) The client's commitment to complementary therapies is not a factor.
Page Ref: 219
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: IX. 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with fatigue.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

7) The nurse is caring for a client who is experiencing chronic fatigue related to medication being taken for seasonal allergies. Which intervention would most likely help this client?
A) A medication change to treat seasonal allergies
B) Physical therapy to promote exercise
C) Acupuncture and massage
D) Sleep medication to increase rest time
Answer: A
Explanation: A) The nurse might expect the provider to try different dosages or different medications to try to relieve the symptoms.
B) Because the fatigue is due to medication side effects, other strategies will not be effective while the client is on the medication.
C) Therapies such as acupuncture and massage are not consistently supported by clinical studies as effective interventions for fatigue.
D) Because the fatigue is due to medication side effects, other strategies will not be effective while the client is on the medication.
Page Ref: 219
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with fatigue.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

8) A client has been prescribed iron supplements to treat fatigue and a hemoglobin level of 9. Which additional information should the nurse suggest to help reduce feelings of fatigue associated with a low red blood cell count? **Select all that apply.**

A) Increasing intake of ice cream

B) Drinking a glass of orange juice each day

C) Increasing intake of red meat

D) Increasing intake of wax beans

E) Increasing intake of green, leafy vegetables

Answer: B, C, E

Explanation: A) Ice cream is not a source of dietary iron and does not enhance the absorption of iron.

B) Iron is absorbed better when accompanied with vitamin C in foods such as orange juice.

C) Red meat is a good source of iron that the client can consume in a healthy diet.

D) Wax beans are not a source of dietary iron and do not enhance the absorption of iron.

E) Green, leafy vegetables are good sources of iron that the client can consume in a healthy diet.

Page Ref: 219

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with fatigue.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

9) A client with multiple sclerosis is complaining of fatigue. In recommending an exercise program to this client, which factor will the nurse need to consider other than physician approval?
A) Complementary dietary recommendations
B) The intensity of the workout
C) Complementary therapy recommendations
D) Pharmacologic therapy
Answer: B
Explanation: A) Complementary dietary recommendations would not be a viable consideration.
B) Clients who report persistent fatigue should be encouraged to begin a physician-approved mild to moderate exercise regimen. Higher intensity exercise does not appear to produce a greater reduction in fatigue, so clients should be instructed to avoid intense workouts that may increase feelings of fatigue. Exercise reduces fatigue in chronic conditions such as multiple sclerosis.
C) Complementary therapies would not be a viable consideration.
D) Pharmacologic therapy would not be a viable consideration.
Page Ref: 219
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with fatigue

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

10) An adult female client is diagnosed with chronic fatigue syndrome. Which statement should the nurse expect to accompany the diagnosis?
A) Continued bed rest will relieve the condition.
B) The client's physician has ruled out an obvious cause for the fatigue.
C) The client is suffering complications from a severe stress reaction.
D) The client needs a rigorous exercise regimen.
Answer: B
Explanation: A) Bed rest will not relieve the condition.
B) Chronic fatigue syndrome occurs when an individual experiences severe tiredness that lasts more than 6 months, is not caused by a primary condition, and is not relieved by stress reduction. Because this syndrome is not caused by a primary condition and lasts for at least half a year before it is diagnosed, the physician will have ruled out an obvious cause for the fatigue by this point.
C) Chronic fatigue syndrome is not caused by a severe stress reaction.
D) Exercise therapy has produced conflicting results in clients with chronic fatigue syndrome and so should be approached with caution.
Page Ref: 218
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Identify the clinical manifestations of fatigue.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

11) A pregnant client experiencing fatigue describes her typical diet as consisting of fast food such as burgers and fries for lunch, takeout from Chinese or Mexican restaurants for dinner, and orange juice or a fruit smoothie in the morning. Which issue should the nurse identify with this diet?

A) The fast food because it's likely high in fat.

B) The takeout food might be saucy and heavy.

C) The burgers contain red meat.

D) The fruit smoothies are processed.

Answer: A

Explanation: A) Fatigue in expectant mothers is often caused by iron-deficiency anemia. The fast food would be a problem because it's fatty.

B) It depends on what the client orders to determine if it is too saucy or heavy.

C) Fatigue in expectant mothers is often caused by iron-deficiency anemia. The fast food would be a problem because it's fatty, not because of the red meat content.

D) The fruit smoothies would likely be high in vitamin C and therefore good for this client.

Page Ref: 219

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Differentiate considerations for care of patients with fatigue throughout the lifespan.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

12) The nurse is reviewing data collected from a client during a health history. Which information should the nurse identify as a lifestyle risk factor for fatigue?
A) Chemotherapy
B) Stress
C) Surgery
D) Inactivity
Answer: D
Explanation: A) Chemotherapy is a medical procedure that is a risk factor for fatigue.
B) Stress is a mood disorder that is a risk factor for fatigue.
C) Surgery is a medical procedure that is a risk factor for fatigue.
D) Inactivity is a lifestyle risk factor for fatigue.
Page Ref: 217
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of fatigue.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

13) The nurse is reviewing data collected during the assessment of a client from a non-English speaking culture. Which word should the nurse use that describes fatigue from culture shock?
A) Linguistic
B) Temporary
C) Geographical
D) Mild
Answer: B
Explanation: A) Culture shock may involve a reaction to changes in language, but not necessarily, and it may be mild or more severe.
B) Culture shock involves adjustment to changes in culture, and so should be temporary in most cases.
C) Culture shock may involve a reaction to changes in geography and may be mild or more severe.
D) Culture shock may be mild or more severe.
Page Ref: 218

Learning Outcome: 3.C. Analyze fatigue as it relates to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of fatigue.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fatigue.

Exemplar 3.D Fibromyalgia

1) The nurse is caring for a client diagnosed with fibromyalgia. Based on this diagnosis, which clinical manifestations might the nurse anticipate for this client? **Select all that apply.**

A) Pain

B) Fatigue

C) Weakness

D) Nausea and vomiting

E) Sleep disturbance

Answer: A, B, E

Explanation: A) Multisite pain is defined as six or more pain sites from a total of nine possible sites located on the head, upper or lower back and spine, chest, abdomen, arms, and/or legs.

B) Fatigue may be mental or physical.

C) Weakness might occur, but it would be caused by fatigue.

D) There is no evidence that nausea or vomiting are symptoms of fibromyalgia.

E) Sleep disturbances cause poor sleep as a manifestation of fibromyalgia.

Page Ref: 221

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Identify the clinical manifestations of fibromyalgia.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

2) The adult child of a client with fibromyalgia asks, "Will I get this condition too?" Which responses should the nurse make? **Select all that apply.**
A) If your diet is high in fatty foods, you have a greater chance of developing fibromyalgia.
B) Having a family member with fibromyalgia increases the risk for developing it.
C) If you exercise often enough you'll be fine.
D) Only people aged 30-50 develop fibromyalgia.
E) Fibromyalgia is more prominent in women.
Answer: B, E
Explanation: A) Diets have been suggested as possible treatment but are not thought to cause the disease.
B) Having a family member with the disease increases the risk for development.
C) The disease has not been linked to lack of exercise.
D) There are many theories about the causes of, and risk factors for, fibromyalgia. It is generally conceded that it is more of a problem for women aged 30-50 than for men.
E) It is generally conceded that it is more of a problem for women aged 30-50 than for men.
Page Ref: 221
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of fibromyalgia.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

3) The spouse of a client experiencing pain, sleep disorders, and stiffness believes that nothing is wrong with the client. Which intervention should the nurse add to the family's plan of care?
A) Medications used to treat fibromyalgia
B) An exercise program to increase energy
C) Information and literature on fibromyalgia
D) Suggested dietary changes to help with the pain
Answer: C
Explanation: A) The healthcare provider orders medications.
B) There is no proof that exercise, or lack thereof, causes fibromyalgia.
C) Accepting a disease like fibromyalgia may be difficult due to the vagueness of the disease. Information and written literature may help the family understand that the disease is real.
D) The healthcare provider orders diets.
Page Ref: 224
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Apply the nursing process in providing culturally competent care to an individual with fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

4) The nurse identifies the problem of chronic pain for a client with fibromyalgia. Which manifestation did the client report that caused the nurse to identify this problem?
A) Pain from eyestrain
B) Pain from a severe skin rash
C) Acute chest pain
D) Tender body points
Answer: D
Explanation: A) Muscle strain of the eye is not a reported symptom.
B) Pain from a rash is not a symptom of fibromyalgia.
C) Acute chest pain is not a symptom of fibromyalgia.
D) Pain from tender body points is a symptom of fibromyalgia.
Page Ref: 224
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Identify the clinical manifestations of fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

5) The family of a client with fibromyalgia asks what they can do to help the client with painful episodes. Which suggestion should the nurse make?
A) Protect the client from injury.
B) Plan a family reunion or vacation.
C) Divide household chores among each member of the family.
D) Keep the client in bed.
Answer: C
Explanation: A) There is no reason to believe that this client is at higher risk for injury than another member of the family.
B) A family reunion or vacation might cause more stress to the client, who would more than likely be planning and packing for such an event.
C) Although the causes and treatments are not all known, there is general agreement that reducing stress may help lessen the effects of fibromyalgia. The nurse could help the family by suggesting ways to decrease stress on the client by having the family pitch in on responsibilities.
D) Keeping the client in bed would not be therapeutic.
Page Ref: 224
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

6) The nurse is discussing goals to relieve pain and fatigue with a client newly diagnosed with fibromyalgia. Which goal statement would be realistic for this client to achieve within 30 days?
A) Cook dinner five nights a week.
B) Join an exercise group to meet five nights a week.
C) Walk a child to school daily.
D) Get a job outside the home.
Answer: A
Explanation: A) Fibromyalgia reduces the client's energy. The client might set as an initial goal to be able to perform daily tasks for the family such as cooking and doing the laundry.
B) Joining an exercise group to meet five nights a week would be unrealistic.
C) Walking a child to school daily would be unrealistic.
D) Getting a job outside of the home would be unrealistic.
Page Ref: 224
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Apply the nursing process in providing culturally competent care to an individual with fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

7) A client is diagnosed with fibromyalgia. Which medication should the nurse anticipate being prescribed as part of the client's treatment plan?
A) Diazepam
B) Milnacipran
C) Aspirin
D) Acetaminophen
Answer: B
Explanation: A) Diazepam is not used to treat fibromyalgia.
B) Milnacipran is a clinical pharmacologic therapy for pain, fatigue, and sleep disruptions for fibromyalgia.
C) Aspirin is not used to treat fibromyalgia.
D) Acetaminophen is not used to treat fibromyalgia.
Page Ref: 222
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

8) A client with three adolescent children is diagnosed with fibromyalgia and asks how to keep up with all of the children's activities. Which suggestion should the nurse make?
A) Attempt to attend all the functions of the children.
B) Negotiate with the children to alternate attendance of their functions.
C) Avoid attending any afterschool functions for the children.
D) Ask the children to limit their activities.
Answer: B
Explanation: A) It is not reasonable for a client with fibromyalgia to try to run the home and attend all of the functions of each child.
B) Because it is too difficult to attend all of the children's functions, the nurse suggests alternating attendance of the children's functions. In this manner, the client can partially meet the needs of each child.
C) Not attending any functions will only add to the client's stress and may worsen symptoms.
D) The children should not have to limit their activities because of the client's illness.
Page Ref: 224
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Apply the nursing process in providing culturally competent care to an individual with fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

9) A client with fibromyalgia asks if a recent infection with the Coxsackie B virus could have caused it. Which response should the nurse make?
A) The Coxsackie B virus has nothing to do with fibromyalgia.
B) The Coxsackie B virus may have triggered the fibromyalgia.
C) The Coxsackie B virus definitely caused the fibromyalgia.
D) The Coxsackie B virus probably caused the fibromyalgia.
Answer: B
Explanation: A) Infections such as hepatitis C virus (HCV), HIV, Coxsackie B, and parvovirus may trigger fibromyalgia.
B) Infections such as Coxsackie B may trigger fibromyalgia.
C) Over 70% of clients have no precipitating factor for the disease.
D) The exact cause of fibromyalgia is unknown.
Page Ref: 221
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

10) The nurse is counseling an adult client with fibromyalgia. Which actions should the nurse take to help the client develop effective coping skills? **Select all that apply.**
A) Ask the client about specific stressors in the client's life and how the client handles them.
B) Inform the client about what to do as the disease worsens.
C) Ask the client about sources of support that the client may be able to rely on.
D) Advise the client that a dimension of self-efficacy is independently developing a response to the problems of fibromyalgia.
E) Suggest to the client that some symptoms may be psychosomatic.
Answer: A, C
Explanation: A) It helps to identify stressors that make pain and fatigue worse, and then develop strategies to avoid those stressors or to minimize symptoms when those stressors occur.
B) Fibromyalgia is not a progressive disease.
C) Getting appropriate help is important in managing fibromyalgia.
D) Clients should be encouraged to see a fibromyalgia specialist, and self-efficacy means engaging in health-promoting behavior to influence the course of the disease, not developing a treatment plan alone.
E) It is important to validate the client's perceptions.
Page Ref: 224
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | Nursing Process: Planning

Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Apply the nursing process in providing culturally competent care to an individual with fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

11) A 13-year-old female client is diagnosed with juvenile primary fibromyalgia syndrome. Which action should the nurse anticipate for this client?

A) Treat the client in much the same way as an adult with fibromyalgia.

B) Chronic fatigue can be ruled out as a likely clinical manifestation.

C) The client's pain will likely have lasted no more than 3 months.

D) The condition will persist into adulthood.

Answer: A

Explanation: A) JPFS is most commonly diagnosed in girls between the ages of 13 and 15. Triggers and symptoms of JPFS are similar to those of adult fibromyalgia, and so interventions with this client are likely to pertain to pain management, fatigue reduction, and sleep disturbance, just as they would for an adult patient.

B) Chronic fatigue will not be ruled out as a clinical manifestation.

C) Because this client's symptoms are likely to be the same as those of an adult with fibromyalgia, the client is likely to experience chronic fatigue, pain lasting more than 3 months.

D) More than 80% of children with juvenile fibromyalgia syndrome will have fibromyalgia that persists into adulthood.

Page Ref: 223

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Differentiate considerations for care of patients with fibromyalgia across the lifespan.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

12) An adolescent client with juvenile primary fibromyalgia syndrome asks if she can be cured and not deal with it as an adult. Which response should the nurse make?
A) The fibromyalgia likely can be cured with proper sleep hygiene, exercise, and pharmacologic management.
B) Fibromyalgia can be difficult to treat effectively, but the symptoms are unlikely to persist into adulthood.
C) It is likely that the fibromyalgia will persist into adulthood, and there is no cure, but the symptoms can be treated and the condition is not life-threatening.
D) The client will suffer from persistent fibromyalgia for the remainder of her life unless a cure can be found.
Answer: C
Explanation: A) There is no cure for fibromyalgia, but it can be treated symptomatically and it is not progressive or life-threatening.
B) There is no cure for fibromyalgia, but it can be treated symptomatically and it is not progressive or life-threatening.
C) More than 80% of children who have JPFS will have fibromyalgia that persists into adulthood.
D) It is not certain that this client's fibromyalgia will persist into adulthood, but it is likely.
Page Ref: 223
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Differentiate considerations for care of patients with fibromyalgia across the lifespan.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

13) The nurse is asked to describe the pathophysiology of fibromyalgia. Which disorder should the nurse explain as the mechanism of fibromyalgia?
A) Muscle strength
B) Respiratory control
C) Heat regulation
D) Pain processing
Answer: D
Explanation: A) Fibromyalgia is not a disorder of muscle strength.
B) Fibromyalgia is not a disorder of respiratory control.
C) Fibromyalgia is not a disorder of heat regulation.
D) Pain associated with fibromyalgia results from central amplification of pain signals, including spontaneous nerve activity, enlarged receptive fields, and abnormal levels of neurotransmitters.
Page Ref: 221
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

14) The nurse is asked to describe the etiology of fibromyalgia. Which response will the nurse make?
A) Stress and poor sleep hygiene are the main precipitating factors for fibromyalgia.
B) No exact cause is known, but some clients with fibromyalgia may have precipitating factors.
C) The primary cause for fibromyalgia in nearly all clients who have it is infection.
D) Precipitating factors for fibromyalgia are primarily physiological.
Answer: B
Explanation: A) Stress and poor sleep hygiene might contribute to the development of fibromyalgia in some people.
B) The exact cause of fibromyalgia is unknown; over 70% of clients with fibromyalgia have no precipitating factor for the disease.
C) An infection might cause fibromyalgia but this would not be the precipitating factor in most clients.
D) Psychosocial stressors might be causative factors for fibromyalgia in some clients.
Page Ref: 221
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

15) The nurse is caring for a client with fibromyalgia. Which finding should the nurse identify as a characteristic of this condition?
A) Difficult to treat
B) Definite as to cause
C) Easy to prevent
D) Brief in its effects
Answer: A
Explanation: A) Fibromyalgia is difficult to treat.
B) No exact cause for fibromyalgia is known, and it may present without precipitating factors.
C) No means of preventing fibromyalgia is known.
D) Fibromyalgia may only be diagnosed if the pain has lasted at least 3 months.
Page Ref: 222
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 3.D. Analyze fibromyalgia as it relates to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with fibromyalgia.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with fibromyalgia.

Exemplar 3.E Sleep-Rest Disorders

1) The nurse is reviewing information received during hand-off report. Which client should the nurse identify as exhibiting hypersomnia?

A) The client only gets about 5 or 6 hours of sleep each night.

B) The client gets roughly 8 hours of sleep each night but can't stay awake during the day.

C) The client consistently has trouble getting to sleep and often lies awake for hours after bedtime.

D) The client experiences repetitive involuntary leg movements that interfere with sleep.

Answer: B

Explanation: A) A client getting 5 or 6 hours of sleep each night is experiencing sleep loss.

B) Hypersomnia is a condition of getting enough sleep at night but still exhibiting daytime drowsiness.

C) Difficulty falling asleep is insomnia.

D) Repetitive involuntary leg movements is restless leg syndrome.

Page Ref: 226

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of sleep-rest disorders.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

2) A client reports having poor sleep. Which factor differentiates lack of sleep due to a sleep disorder from lack of sleep due to another developing condition?
A) The length of sleep
B) The quality of sleep
C) The symptoms of lack of sleep
D) The cause for the lack of sleep
Answer: D
Explanation: A) The length of sleep may not differ.
B) The quality of sleep may not differ.
C) The symptoms related to the lack of sleep may not differ.
D) The etiology, or cause, of the lack of sleep will differ depending on whether the condition is because of a sleep disorder or another developing condition.
Page Ref: 227
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Identify the clinical manifestations of sleep-rest disorders.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

3) An older adult client is talking with the nurse about sleep problems. Which fact regarding sleep should the nurse teach this client?
A) All elderly individuals experience disrupted sleep and depression.
B) The need for sleep decreases with age.
C) Sleep problems signal the onset of other developing medical conditions.
D) The elderly do not experience as much deep sleep as a younger person.
Answer: D
Explanation: A) Not all elderly people experience depression and sleep disturbances.
B) Generally, the amount of sleep needed is about the same for the youth, middle-aged, and older adult.
C) Sleep problems may be from a sleep disorder as the primary condition and not another developing medical condition.
D) Starting at age 20, there is a reduction in stages 3 and 4 NREM sleep and in REM sleep, which is the deepest sleep. This reduction in deep sleep progresses with aging.
Page Ref: 231
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Differentiate considerations for care of patients with sleep-rest disorders across the lifespan.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

4) An older adult client recovering from prostate surgery is waking up frequently during the night. Which client statement supports the problem of disturbed sleep pattern?
A) "The pain in my hips is unbearable at times."
B) "I walk for half an hour after I eat breakfast."
C) "I take my Zoloft as soon as I get up in the morning."
D) "I have one cup of regular coffee in the morning."
Answer: A
Explanation: A) Physical discomfort or pain, especially from osteoarthritis and focused in the hips, often disrupts the sleep of older persons.
B) A short walk in the morning is an appropriate type and timed exercise.
C) The client is taking his prescribed antidepressant medication Zoloft (sertraline hydrochloride) appropriately because it has a stimulant effect and should be taken in the morning.
D) Caffeine intake of one morning cup of coffee should have little interference with sleeping during the night.
Page Ref: 182
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Differentiate considerations for care of patients with sleep-rest disorders across the lifespan.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

5) A client with clinical depression reports drinking alcohol before bedtime to help with sleep, but wakes up early with anxiety and the inability to fall asleep again. Which goal would be least appropriate for this client?
A) Avoid the use of alcohol late in the evening.
B) Reduce or remove environmental distractions from the bedroom.
C) Maintain a consistent bedtime.
D) Report decreased snoring.
Answer: D
Explanation: A) For this client, avoiding the use of alcohol late in the evening would definitely be a worthwhile goal.
B) For this client ensuring an environment conducive to sleep would be an appropriate goal.
C) For this client, a routine conducive to sleep would be appropriate.
D) The client's history does not indicate that snoring or apnea is a problem, so a goal related to decreasing snoring is probably least appropriate for this client unless there is reason to suspect this as a problem.
Page Ref: 232
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Apply the nursing process in providing culturally competent care to an individual with a sleep-rest disorder.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

6) A resident in an assisted-living facility is restless most nights and sits in the lounge area reading because of insomnia. Which outcome should the nurse expect if the resident continues with this pattern of sleep?
A) Sleep paralysis
B) Onset of cardiac dysfunction
C) Onset of new underdiagnosed health problems
D) The client's activities during the day may be hindered by these episodes.
Answer: D
Explanation: A) Sleep paralysis is a clinical manifestation of narcolepsy, not insomnia.
B) There is no evidence that insomnia leads to cardiac problems.
C) There is no evidence that the resident client is demonstrating underlying problems.
D) Insomnia is defined as an inability to fall asleep, or stay asleep, on most nights for over a month. The individual experiencing insomnia is at risk for daytime drowsiness and may experience cognitive deficits, fatigue, and irritability, all of which can hinder the client's activities during the day.
Page Ref: 226
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Identify the clinical manifestations of sleep-rest disorders.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

7) A client with a history of insomnia is scheduled for a polysomnogram that will not include audio and video equipment but will monitor blood oxygen levels, heart rate, breathing, eye and leg movements, and brain waves. Which disorder is least likely to be identified in this test?
A) Periodic limb movement disorder
B) Sleep apnea
C) Sleep talking
D) Restless leg syndrome
Answer: C
Explanation: A) The monitoring of leg movements detects periodic limb movement disorder.
B) Heart rate, breathing, and blood oxygen levels as well as audio monitoring can detect snoring and breathing changes that suggest sleep apnea.
C) Audio and video equipment can also detect parasomnias such as sleep talking, but because such equipment is not being used in this case, the study is least likely to identify this disorder.
D) The monitoring of leg movements detects restless leg syndrome.
Page Ref: 227
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a sleep-rest disorder.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

8) The nurse is assessing a client for a sleep-rest disorder. Which client behavior is most associated with this disorder?
A) The client answers history questions in detail.
B) The client expresses impatience after two or three questions and insists that the nurse hurry up and finish.
C) The client expresses a concern about the privacy of the information he reveals.
D) The client cannot answer definitely whether he sleeps in strange positions.
Answer: B
Explanation: A) Answering history questions in detail does not demonstrate decreased cognitive functioning.
B) Observation can indicate the presence of fatigue, decreased cognitive functioning and coordination, dark circles under the eyes, and irritability. Expressing impatience after just two or three questions is indicative of irritability, which could be a sign of sleep deprivation from a sleep-rest disorder.
C) A concern about privacy is a normal concern.
D) The client may not be able to answer about strange sleep positions because that may be unknown.
Page Ref: 232
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a sleep-rest disorder.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

9) The parent of an adolescent is frustrated because the child goes to sleep late and cannot get up in the morning in time for school. Which response by the nurse is the most appropriate?
A) Inform her that several techniques can potentially help correct this problem.
B) Recommend a polysomnography (PSG).
C) Indicate that this is simply a normal change of the body's internal clock associated with puberty, and it will work itself out.
D) Ask about other medical conditions because the adolescent's sleep patterns indicate the onset of a chronic illness.
Answer: A
Explanation: A) Adolescents experience changes in the body's internal clock associated with puberty that in some adolescents cause a delay in melatonin release each night; the result is delayed sleep phase syndrome. Signs of delayed sleep phase syndrome include an inability to fall asleep and wake up at the desired time.
B) A sleep study would only be indicated if the adolescent were experiencing other sleep disturbance symptoms.
C) The use of sleep hygiene, sleep restriction therapy, and relaxation techniques can be beneficial in the treatment of this syndrome.
D) This isn't a sign of another illness but shouldn't be ignored either.
Page Ref: 209
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Differentiate considerations for care of patients with sleep-rest disorders across the lifespan.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

10) The nurse instructs an adult client with sleep apnea on the use of a continuous positive airway pressure (CPAP) machine. Which instruction least relates to ensuring the client's comfort with the device?

A) Use a properly sized mask with the straps tight.
B) Instruct the client to wear the mask with air pressure while sleeping.
C) Show how to adjust the pressure to reduce difficulty exhaling.
D) Demonstrate relaxation techniques to reduce a claustrophobic feeling when wearing the mask.

Answer: B

Explanation: A) Wearing the right size mask and keeping the straps tight may ensure comfort when using the device.

B) Wearing the mask with air pressure while sleeping is simply the general way the device should be used and doesn't make any special allowances for the comfort of the client.

C) Reducing the difficulty of exhalation by properly adjusting pressure would ensure comfort when using the device.

D) Relaxation exercises to reduce the claustrophobic feelings caused by wearing the mask would ensure comfort when using the device.

Page Ref: 230

Client Need/Sub: Physiological Adaptation: Basic Care and Comfort

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a sleep-rest disorder.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

11) A client seeks medical attention for difficulty sleeping. In which way should the nurse anticipate the client's condition impacts activities of daily living?
A) Interfere
B) Decrease
C) Change
D) Increase
Answer: A
Explanation: A) Sleep disorders can lead to disrupted activities of daily living, and so primarily interfere with such activities.
B) Sleep disorders do not necessarily decrease activities of daily living.
C) Sleep disorders do not necessarily change activities of daily living.
D) Sleep disorders do not necessarily increase activities of daily living.
Page Ref: 232

Learning Outcome: 3.E. Analyze sleep-rest disorders as they relate to comfort. Describe the pathophysiology, etiology, risk factors, and prevention of sleep-rest disorders.
MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

12) A client is diagnosed with sleep apnea. Which difficulty should the nurse expect to assess in this client?
A) Thinking
B) Breathing
C) Waking up
D) Controlling motor functions
Answer: B
Explanation: A) Cognitive deficits are more typical of insomnia.
B) Sleep apnea can manifest as snoring or gasping during sleep, and treatment may involve devices to assist with ventilations during sleep.
C) Frequent awakenings typically accompany sleep apnea, not difficulty waking up.
D) Difficulty controlling the body is more typical of restless leg syndrome.

MNL LO: Demonstrate understanding of the concept of comfort in the care of a patient with sleep-rest disorder.

***Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e* (Pearson)**
Module 4 Digestion

The Concept of Digestion

1) A client presents with delayed wound healing. During the physical assessment, which nutrient deficiency should the nurse anticipate based on the data?
A) Protein
B) Digestive enzymes
C) Insulin
D) Carbohydrates
Answer: A
Explanation: A) A deficiency of protein may delay wound healing.
B) Digestive enzymes aid in the digestion of nutrients.
C) Insulin allows glucose to be used by the cells.
D) Carbohydrates are a source of energy.
Page Ref: 238
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.1. Analyze the physiology of digestion in the body.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

2) The nurse is reviewing a list of clients waiting to be seen in the clinic. Which clients are at the highest risk of experiencing severe nausea and vomiting? **Select all that apply.**
A) A 47-year-old with a 3-hour history of chest pressure
B) A 61-year-old reporting sudden onset of vertigo
C) A 72-year-old with an asthma exacerbation
D) A 23-year-old who sustained a head injury in a fall
E) A 19-year-old who is 6 weeks pregnant
Answer: A, B, D, E
Explanation: A) The vomiting center in the medulla of the brain may be affected by an acute myocardial infarction.
B) The vomiting center in the medulla of the brain may be affected by the vestibular system of the ear.
C) An asthma exacerbation is least likely to cause severe nausea and vomiting.
D) The vomiting center in the medulla of the brain may be affected by increased intracranial pressure.
E) The vomiting center in the medulla of the brain may be affected by pregnancy.

Nursing Process: Assessment

Learning Outcome: 4.3. Outline the relationship between digestion and other concepts.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

3) The nurse is providing care for several clients on a medical-surgical unit. Which condition should the nurse anticipate being treated with surgery?
A) Hepatitis
B) Pancreatitis
C) Pyloric stenosis
D) Malabsorption disorder
Answer: C
Explanation: A) Hepatitis is treated medically.
B) Pancreatitis is treated medically.
C) Pyloric stenosis ultimately requires surgery to split the pyloric muscle to allow passage of food and fluid.
D) Malabsorption disorder is treated medically.
Page Ref: 241

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care.
Nursing Process: Assessment
Learning Outcome: 4.2. Differentiate alterations in digestion.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

4) A 4-month-old infant with vomiting and diarrhea has a temperature of 37°C, apical HR: 130, R: 40/min. The client's abdomen is soft, concave, has 10 gurgles auscultated in 1 minute in all four quadrants, and tympani to percussion. Which collaborative care action should the nurse anticipate?

A) Check the surgical call schedule and reserve an operating suite.

B) Place the infant NPO for a barium swallow.

C) Prepare a milk-based infant formula to replace fluids.

D) Complete a thorough digestion assessment interview with the mother.

Answer: D

Explanation: A) Nothing in the assessment indicates a surgical emergency.

B) A barium swallow is not indicated for diarrhea.

C) Milk-based formulas would be avoided until symptoms subside.

D) The assessment data for this pediatric client indicates a nonemergent alteration in digestion that requires additional interview information from the parent.

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 4.5. Differentiate common assessment procedures and tests used to examine digestion.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

5) A client is scheduled for a diagnostic test to determine digestion status. Which test can be completed at any time?
A) Barium swallow
B) Amylase
C) Endoscopy
D) Lipid panel
Answer: B
Explanation: A) A barium swallow requires fasting.
B) An amylase test does not require any special preparation.
C) An endoscopy requires fasting.
D) A lipid panel requires fasting.
Page Ref: 249

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care.
Nursing Process: Planning
Learning Outcome: 4.5. Differentiate common assessment procedures and tests used to examine digestion.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

6) A client with acute pancreatitis is being discharged. What statement indicates that discharge teaching for self-care after hospitalization was effective?
A) "I will avoid onions, caffeine, and spices."
B) "I will take the antibiotics for 2 weeks."
C) "I will avoid alcoholic beverages."
D) "I will get immunized prior to my vacation."
Answer: C
Explanation: A) Onions, caffeine, and spices increase the risk of GERD.
B) Antibiotics are used to prevent pyloric stenosis. Onions, caffeine, and spices increase the risk of GERD.
C) Alcohol increases the risk of pancreatitis.
D) Immunizations can prevent specific types of hepatitis.

Learning Outcome: 4.6. Analyze independent interventions nurses can implement for patients with alterations in digestion.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

WW.TBSM.WS

7) The nurse is caring for an older adult who recently immigrated and is diagnosed with gastroesophageal reflux disease (GERD). Which intervention would best improve this client's adherence to dietary changes?
A) Scheduling low-fat meal deliveries to the home
B) Providing printed diet information in the native language
C) Interviewing the client to assess the current diet
D) Giving a list of foods to avoid to the spouse
Answer: C
Explanation: A) Scheduling low-fat meal delivery to the home, is not appropriate until the nurse has information on which to base an individualized, culturally sensitive teaching plan.
B) Giving printed diet information is not appropriate until the nurse has information on which to base an individualized, culturally sensitive teaching plan.
C) Interviewing the client to assess the current diet will provide information on which to base a collaborative nutrition plan.
D) Giving a list of foods to avoid to the spouse is not appropriate until the nurse has information on which to base an individualized, culturally sensitive teaching plan.
Page Ref: 240

Learning Outcome: 4.6. Analyze independent interventions nurses can implement for patients with alterations in digestion.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

8) The nurse is considering nutritional support for a client experiencing severe side effects of chemotherapy. Which independent and collaborative interventions will best limit the adverse digestive and nutritional effects of chemotherapy?
A) Encourage client to drink 350 mL of clear liquids within 1 hour prior to meals.
B) Position the client flat during intermittent enteral nutrition feedings.
C) Verify that enteral nutrition and total parenteral nutrition (TPN) are never used concurrently.
D) Teach the client relaxation techniques in addition to offering IV ondansetron.
Answer: D
Explanation: A) Nausea is worsened by drinking fluid within 1 hour of meals.
B) Clients should be positioned with the HOB elevated 30 degrees during enteral nutrition feedings.
C) Enteral nutrition and TPN are used concurrently.
D) The American Society of Clinical Oncologists suggests that individuals with cancer who are experiencing nausea and vomiting try distraction, relaxation, positive imagery, and acupuncture. The NCCIH also suggests relaxation techniques for those with chemotherapy-induced nausea and vomiting. Ondansetron is a serotonin receptor agonist used commonly as an antiemetic.

WwW.TeSm.Us

9) The nurse is preparing a presentation to a group of adolescent clients regarding proper nutrition. Which information is appropriate for this group?
A) The high metabolism of the typical adolescent lowers nutritional requirements.
B) It is normal for adolescents to consume a lot of calories, but their diet should still be balanced.
C) Roughly half of an adolescent's daily caloric intake should come from fats.
D) The taste preferences of adolescents typically correlate to the nutritional value of what they eat.
Answer: B
Explanation: A) The high metabolism of the typical adolescent raises nutritional requirements.
B) Bodily demands for calories and nutrients increase dramatically during this time. Adolescent girls require about 2200 calories per day, and adolescent boys require about 2800 calories per day.
C) Roughly 50% of calories should come from complex carbohydrates, 30% from fats, and 20% from proteins.
D) Taste preferences are one of the contributing factors to adolescents exceeding fat intake requirements and not getting enough other nutrients or vitamins, minerals, and fiber.
Page Ref: 255
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 4.8. Differentiate considerations related to the assessment and care of patients with alterations in digestion throughout the lifespan.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

10) The nurse is caring for a 6-month-old infant with pyloric stenosis. Which statement regarding this client's digestive system should the nurse question?
A) The client has voluntary control over swallowing.
B) Enzymes from the client's pancreas are sufficient to aid in digestion.
C) The client has a complete set of primary teeth.
D) The client's tongue is larger than an adult's in comparison to the nasal and oral passages.
Answer: C
Explanation: A) An infant develops voluntary control over swallowing by 6 weeks.
B) Enzymes are sufficient to aid in digestion by 4-6 months, so an infant at 6 months should have sufficient enzymes for digestion.
C) Most children have a complete set of primary teeth by 3-6 years of age. At 6 months, the first teeth begin to erupt.
D) The infant's tongue is larger than that of a child or adult in comparison to the nasal and oral passages.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

Exemplar 4.A Gastroesophageal Reflux Disease

1) The nurse is explaining the alteration in normal function to a client recently diagnosed with gastrointestinal reflux disease (GERD). Which etiology contributing to GERD will the nurse include in the teaching session?
A) Transient constriction of the lower esophageal sphincter
B) Decreased pressure within the stomach
C) Incompetent lower esophageal sphincter
D) Prolonged constriction of the upper esophageal sphincter
Answer: C
Explanation: A) The lower esophageal sphincter is normally constricted except during swallowing.
B) Increased pressure in the stomach can cause acid to reflux into the esophagus.
C) An incompetent lower esophageal sphincter remains open, allowing gastric acid to reflux into the esophagus.
D) The action of the upper esophageal sphincter is not a cause of GERD.
Page Ref: 256
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 4.A. Analyze GERD as it relates to digestion. Describe the etiology of GERD.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

2) The nurse is providing care to several clients in an outpatient clinic. Which client is at high risk of developing gastroesophageal reflux disorder (GERD)?

A) A client who is 6 weeks pregnant
B) A client who is morbidly obese
C) A client who follows a strict vegetarian diet
D) A client who drinks one glass of wine monthly

Answer: B

Explanation: A) Pregnancy is an increasing risk factor in the later stages due to pressure on the stomach.
B) Obesity is a risk factor for GERD.
C) A vegetarian diet is not a risk factor for GERD.
D) Rare alcohol consumption is not as strong a risk factor for GERD as morbid obesity.

Page Ref: 256
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care.
Nursing Process: Assessment
Learning Outcome: 4.A. Analyze GERD as it relates to digestion. Compare the risk factors and prevention of GERD.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

3) The nurse instructs the parent of a pediatric client with gastroesophageal reflux disorder (GERD) on feeding approaches. Which observation demonstrates correct procedure for preventing GERD symptoms?
A) Burping the infant after 4 ounces of formula are taken
B) Thinning the formula with water prior to feeding
C) Positioning the infant upright for a minimum of 30 minutes
D) Warming the formula prior to feeding
Answer: C
Explanation: A) Infants with GERD should be burped after every 1-2 ounces of formula are taken.
B) Pre-thickened formulas can also reduce GERD symptoms.
C) Positioning the infant upright for 30 minutes after a feeding can reduce GERD symptoms.
D) Warming the formula does not impact GERD symptoms.
Page Ref: 260
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 4.A. Analyze GERD as it relates to digestion. Differentiate care of patients with GERD across the lifespan.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

4) A client with burning pain in the chest of a 7 on a 0 to 10 pain scale is diagnosed with gastroesophageal reflux disorder (GERD) secondary to hiatal hernia. Which problem will the nurse make a priority?
A) Impaired gastrointestinal motility
B) Lack of knowledge about nutrition
C) Acute pain
D) Inadequate health maintenance skills
Answer: C
Explanation: A) There is no evidence that the client has impaired gastrointestinal motility. Dysfunctional gastrointestinal motility and ineffective health maintenance are less urgent.
B) There is no evidence that the client lacks knowledge about nutrition.
C) Acute pain management is the priority of nursing care.
D) There is no evidence that the client has inadequate health maintenance skills.
Page Ref: 261
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 4.A. Analyze GERD as it relates to digestion. Apply the nursing process in providing culturally competent care to an individual with GERD.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

WW.TBSM.WS

5) A client with a history of gastroesophageal reflux disorder (GERD) presents with metabolic alkalosis. Which medication should the nurse suspect contributed to the acid-base imbalance?

A) Aluminum hydroxide
B) Omeprazole
C) Ranitidine
D) Metoclopramide

Answer: A

Explanation: A) Aluminum hydroxide antacids neutralize gastric acid. Overuse of antacids may cause metabolic acidosis.
B) Omeprazole does not cause metabolic alkalosis.
C) Ranitidine does not cause metabolic alkalosis.
D) Metoclopramide does not cause metabolic alkalosis.

Page Ref: 259

Cognitive Level: Understanding

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 4.A. Analyze GERD as it relates to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with GERD.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

6) An adult client with a BMI of 39 and who smokes 1 pack of cigarettes per day is diagnosed with erosive esophagitis. Which recommendation should the nurse make when the client refuses oral medications as treatment? **Select all that apply.**
A) Assess the client's readiness for change in smoking cessation and weight loss.
B) Interview the client and spouse for a 24-hour recall of usual food content, intake, and meal times.
C) Enlist the client's son to elevate the foot of the client's bed at home 6 inches.
D) Offer the client a surgical consult to reduce the necessity of medication.
E) Omit the pharmacist notification of the interprofessional team meeting about the client.
Answer: A, B
Explanation: A) Weight loss and smoking cessation will improve the symptoms of GERD.
B) Determining food types, amounts, and times of consumption can help the client avoid foods that stimulate acid production and avoid eating prior to lying down.
C) The head of the bed should be elevated and the team should recommend this to the client rather than enlisting the client's son.
D) A surgical consult should come from the primary provider and will not necessarily reduce the need for medication.
E) The pharmacist should be included in the interprofessional team meeting to give input to strategies to improve the client's receptivity to medication therapy.
Page Ref: 258
Cognitive Level: Applying
Client Need/Sub: Physiological Adaptation: Physiological Integrity
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation and therapies used by interprofessional teams in the collaborative care of an individual with GERD.

Learning Outcome: 4.A. Analyze GERD as it relates to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with GERD.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

7) The nurse implements a plan of care for an adult client with gastroesophageal reflux disorder (GERD). Which statement indicates to the nurse that the client has been adhering to the plan?
A) "I can wear snug spandex camisoles if I feel comfortable."
B) "I have switched from margaritas to wine."
C) "I've lost 6 pounds because I eat every 3 hours and never before bed."
D) "I take a Tums with the ranitidine to make it work better."
Answer: C
Explanation: A) Tight-fitting clothing such as spandex camisoles can worsen GERD, regardless of whether the client feels comfortable wearing them.
B) Changing from margaritas to wine will not improve GERD.
C) Appropriate client outcomes are freedom from pain and knowledge of lifestyle changes to manage GERD. Weight loss, small, frequent meals, and avoiding lying down within 3 hours of eating indicate correct management.
D) Antacids such as Tums should be avoided within 1 hour before or after an H_2-receptor blocker like ranitidine.
Page Ref: 262
Cognitive Level: Evaluating
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 4.A. Analyze GERD as it relates to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with GERD.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

8) The nurse is assessing a 9-month-old infant who is having symptoms of gastroesophageal reflux disease (GERD). Which finding would be unusual for the nurse to assess?
A) Weight gain
B) Vomiting
C) Irritability
D) Wheezing
Answer: A
Explanation: A) Weight gain would be normal and not a clinical manifestation of GERD in a client aged 9 months.
B) Clinical manifestations of GERD in children younger than 1 year including vomiting.
C) Clinical manifestations of GERD in children younger than 1 year may include irritability.
D) Respiratory symptoms such as choking, wheezing, and coughing may also occur.
Page Ref: 260
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.A. Analyze GERD as it relates to digestion. Differentiate care of patients with GERD across the lifespan.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

9) A pregnant client in the second trimester is experiencing worsening gastroesophageal reflux disease (GERD). Which information should the nurse question for this client?
A) Eating smaller and more frequent meals.
B) Avoiding foods that are known to be triggers for GERD.
C) Proton pump inhibitors (PPIs) are safe to use, with the exception of omeprazole.
D) The use of antacids containing sodium bicarbonate is recommended.
Answer: D
Explanation: A) Eating small, frequent meals may help the symptoms.
B) Avoiding foods that trigger symptoms may help the symptoms.
C) The majority of PPIs are considered safe for use by pregnant women; the exception is omeprazole. The FDA has concerns about fetal safety associated with maternal omeprazole use.
D) Antacids that contain sodium bicarbonate can lead to fluid retention, and pregnant women should avoid using them. Antacids that contain calcium carbonate, which do not cause fluid retention, may be an appropriate alternative.
Page Ref: 261
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 4.A. Analyze GERD as it relates to digestion. Differentiate care of clients with GERD across the lifespan.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with gastroesophageal reflux disease.

Exemplar 4.B Hepatitis

1) A client is diagnosed with viral hepatitis transmitted by the fecal-oral route. Which conditions may be acquired by this mode of transmission?
A) Hepatitis A (HAV) and hepatitis E (HEV)
B) Hepatitis B (HBV) and hepatitis C (HCV)
C) Hepatitis D (HDV)
D) Hepatitis A (HAV), hepatitis B (HBV), hepatitis C (HCV), hepatitis D (HDV), and hepatitis E (HEV)
Answer: A
Explanation: A) Hepatitis A (HAV) and hepatitis E (HEV) are transmitted by the fecal-oral route.
B) Hepatitis C (HCV) is transmitted through blood and body fluids. Hepatitis B (HBV) is transmitted by blood, body fluids, and perinatal routes.
C) Hepatitis D (HDV) is transmitted by blood, body fluids, and perinatal routes.
D) Hepatitis A (HAV) and hepatitis E (HEV) are transmitted by the fecal-oral route. Hepatitis C (HCV) is transmitted through blood and body fluids. Hepatitis B (HBV) and hepatitis D (HDV) are transmitted by blood, body fluids, and perinatal routes.
Page Ref: 264
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.B. Analyze hepatitis as it relates to digestion. Describe the etiology of hepatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with hepatitis.

2) The nurse instructs a group of high school students on the transmission of hepatitis. Which student statement indicates the need for further education?
A) "Body piercing or tattoo with infected equipment."
B) "Contaminated food or fluids."
C) "Alcoholism or high doses of acetaminophen."
D) "Bite of an infected mosquito or tick."
Answer: D
Explanation: A) Body piercings or tattoos with infected equipment can cause hepatitis.
B) Contaminated food or fluids can cause hepatitis.
C) Alcoholism or high doses of acetaminophen can cause hepatitis.
D) Hepatitis is not caused by the bite of a mosquito or tick.
Page Ref: 264
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 4.B. Analyze hepatitis as it relates to digestion. Compare the risk factors and prevention of hepatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with hepatitis.

3) An adolescent client recently diagnosed with hepatitis lives with the parents. Which recommendation to the client's parents will best prevent them from acquiring hepatitis B (HBV)?
A) Refuse to donate blood.
B) Avoid contaminated water.
C) Obtain postexposure prophylaxis.
D) Abstain from alcohol.
Answer: C
Explanation: A) Donating blood will not increase the risk of acquiring HBV.
B) HBV is not spread in water.
C) Obtaining postexposure prophylaxis treatment will best help the client's parents from acquiring HBV.
D) Alcohol abuse is implicated in nonviral hepatitis.
Page Ref: 268
Cognitive Level: Understanding
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 4.B. Analyze hepatitis as it relates to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a congenital heart defect.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with hepatitis.

4) An older client with acute hepatitis B has fatigue, avoids sexual intercourse, drinks 3 to 5 alcohol beverages a week, has right upper quadrant abdominal pain, and pruritis. Which findings indicate that the client's hepatitis may have progressed to a chronic stage? **Select all that apply.**
A) Fatigue
B) Drinks 3-5 mixed drinks weekly socially
C) RUQ pain
D) Pruritus
E) Avoiding sexual intercourse
Answer: A, C, D
Explanation: A) Fatigue is a clinical manifestation of chronic hepatitis.
B) The client being a social drinker does not indicate anything about the progress of the client's hepatitis.
C) Right upper quadrant abdominal pain is a clinical manifestation of chronic hepatitis.
D) Pruritis is a clinical manifestation of chronic hepatitis.
E) Avoiding sexual intercourse is not a manifestation of chronic hepatitis.

Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Evidence and best practices for nursing. | Nursing Process: Assessment
Learning Outcome: 4.B. Analyze hepatitis as it relates to digestion. Differentiate care of patients with hepatitis across the lifespan.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with hepatitis.

5) The nurse is planning care for a client with chronic hepatitis. Which collaborative discipline will be most helpful in treating continued alcohol use?
A) Social worker
B) Primary provider
C) Pharmacist
D) Dietitian
Answer: A
Explanation: A) The social worker is an expert at identifying additional resources for treatment of substance abuse.
B) The primary provider will contribute to the plan of care.
C) The pharmacist will contribute to the client's plan of care.
D) The dietician will contribute to the client's plan of care.
Page Ref: 267
Cognitive Level: Understanding
Client Need/Sub: Safe and Effective Care Environment: Management of Care
Standards: QSEN Competencies: III.A.1. Learning Outcome: 4.B. Analyze hepatitis as it relates to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with hepatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with hepatitis.

6) A client who, with symptoms of the prodromal phase of hepatitis, has a positive anti-HAV IgM. Which interventions should the nurse add to the client's plan of care? **Select all that apply.**
A) High-fat, low-calorie, and no-alcohol diet teaching
B) Instruct on acceptable pain medication
C) Early treatment with lamivudine
D) Referral to the liver transplant team
E) Family teaching for transmission prevention
Answer: B, E
Explanation: A) A low-fat, high-calorie diet is recommended.
B) Education on acceptable pain medication is necessary due to the toxic effect of common over-the-counter pain medicine.
C) Most clients recover from acute viral hepatitis without pharmacologic treatment.
D) Most clients recover from acute viral hepatitis without a liver transplant.
E) Family teaching is appropriate to avoid transmission.
Page Ref: 270
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 4.B. Analyze hepatitis as it relates to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a congenital heart defect.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with hepatitis.

7) A young adult who works in a restaurant has been treated for viral hepatitis at a healthcare clinic. Which client outcome indicates the need for additional intervention? **Select all that apply.**
A) Body mass index (BMI) changes from 24 to 21.
B) Return demonstration of hand washing is correctly performed.
C) Social Services notified the Health Department of the occurrence.
D) Red scratch marks are noted on the arms and trunk.
E) Client denies abdominal or epigastric pain.
Answer: A, D
Explanation: A) The client will need additional intervention if weight loss occurs.
B) No additional intervention is needed if hand washing is performed correctly.
C) The health department must be notified if a food service worker is diagnosed due to possible exposure of patrons.
D) The client will need additional intervention if continued itching occurs as evidenced by the red scratch marks.
E) No additional intervention is needed if pain is controlled.
Page Ref: 271
Cognitive Level: Evaluating
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 4.B. Analyze hepatitis as it relates to digestion. Apply the nursing process in providing culturally competent care to an individual with hepatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with hepatitis.

8) The nurse is planning a teaching session for expectant mothers regarding pediatric clients and hepatitis. Regarding hepatitis A, which statement is correct?
A) Infection of the mother is the most common reason hepatitis A spreads to children.
B) A daycare is typically a high-risk environment for the spread of hepatitis A.
C) Children with hepatitis A are commonly asymptomatic.
D) Hepatitis A in children is typically a very serious illness with long-term health effects.
Answer: B
Explanation: A) Hepatitis A is not perinatal.
B) Hepatitis A is the most common type of hepatitis in children and is often spread at daycare centers where children are in diapers or are being potty trained.
C) Children with hepatitis B may be asymptomatic, but in the majority of cases, hepatitis A is mild and causes flulike symptoms.
D) In the majority of cases, hepatitis A rarely has long-term consequences.
Page Ref: 267
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 4.B. Analyze hepatitis as it relates to digestion. Differentiate care of patients with hepatitis across the lifespan.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with hepatitis.

9) A nurse is caring for a client diagnosed with an HBV infection. Which clinical manifestation indicates that the client had entered the icteric phase?
A) Fatigue
B) Jaundice
C) Loss of appetite
D) Nausea
Answer: B
Explanation: A) Fatigue normally occurs in hepatitis B.
B) The icteric phase begins with the onset of jaundice, approximately 5-10 days after initial symptoms manifest, although some clients will never develop jaundice.
C) Loss of appetite occurs during the prodromal phase of the infection.
D) Nausea can occur during the prodromal phase of the infection.
Page Ref: 266

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.B. Analyze hepatitis as it relates to digestion. Identify the clinical manifestations of hepatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with hepatitis.

Exemplar 4.C Malabsorption Disorders

1) A client with celiac disease experiences frequent diarrhea. Which additional problems should the nurse anticipate in this client? **Select all that apply.**
A) Skin breakdown
B) Fluid and electrolyte imbalance
C) Hair loss
D) Lifestyle issues
E) Sexual dysfunction
Answer: A, B, D
Explanation: A) Clients with diarrhea may have perianal skin irritation and skin breakdown.
B) Diarrhea disturbs the fluid and electrolyte balance and can disrupt normal life activities.
C) There is no known direct connection between diarrhea and hair loss.
D) Diarrhea can disrupt normal life activities.
E) There is no known direct connection between diarrhea and sexual dysfunction.
Page Ref: 274
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.C. Analyze malabsorption disorders as they relate to digestion. Identify the clinical manifestations of malabsorption disorders.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with a malabsorption disorder.

2) An older adult, African American client with a history of celiac disease experiences abdominal cramps, pain, and diarrhea after eating foods such as steak, cheese, and ice cream. Which condition should the nurse suspect is occurring with this client?
A) Acute pancreatitis
B) Appendicitis
C) Lactase deficiency
D) Food poisoning
Answer: C
Explanation: A) The most common risk factor for pancreatitis is alcohol abuse.
B) Appendicitis usually involves loss of appetite and nausea and/or vomiting soon after abdominal pain begins.
C) Lactose intolerance is more common in Native Americans, Asians, Hispanics, and African Americans and in those with a history of celiac disease.
D) Food poisoning generally causes some nausea and vomiting.
Page Ref: 274
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.C. Analyze malabsorption disorders as they relate to digestion. Compare the risk factors and prevention of malabsorption disorders.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with a malabsorption disorder.

3) A school nurse is providing care to a number of school-age children diagnosed with celiac disease. Which interventions are appropriate for the nurse to implement with this group of students? **Select all that apply.**

A) Teaching about gluten-free food choices

B) Emphasizing low-calorie food selections

C) Implementing a school-based prevention program to eliminate the disease process

D) Labeling gluten-free choices in the school lunch program

E) Demonstrating coping strategies for living with celiac disease

Answer: A, D, E

Explanation: A) Appropriate interventions for the school nurse to implement include teaching the children with celiac disease about gluten-free food choices.

B) Food selections should be high in calories and protein.

C) Celiac disease cannot be prevented.

D) The nurse would implement the labeling of gluten-free food choices in the school lunch program to aid the children in choosing foods to eat while at school.

E) School-age clients may also benefit from learning about coping strategies.

Page Ref: 274

Cognitive Level: Applying

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 4.C. Analyze malabsorption disorders as they relate to digestion. Differentiate care of patients with malabsorption disorders across the lifespan.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with a malabsorption disorder.

4) An older adult client lives alone, has limited financial resources, and has a history of celiac disease. Which problems should the nurse focus on when planning care for this client? **Select all that apply.**

A) Constipation

B) Undernutrition

C) Fluid volume excess

D) Diarrhea

E) Chronic pain

Answer: B, C, D, E

Explanation: A) Constipation is not a symptom of celiac disease.

B) Clients with celiac disease often have nutritional imbalance, including anemia and vitamin deficiencies.

C) Clients with celiac disease often have a fluid imbalance.

D) Clients with celiac disease often have impaired absorption of fluids and electrolyte, which leads to diarrhea.

E) Clients with celiac disease often have pain related to abdominal bloating and cramping.

Page Ref: 275

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

WwW.TeSm.Ws

Learning Outcome: 4.C. Analyze malabsorption disorders as they relate to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a malabsorption disorder.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with a malabsorption disorder.

5) A school-age child, recently diagnosed with celiac disease, is underweight, vitamin deficient, and anemic and experiences frequent diarrhea. In addition to removing gluten from his diet, which additional recommendations should the nurse provide for this child and family? **Select all that apply.**

A) Fat restriction
B) A high-carbohydrate diet
C) Vitamin supplements
D) High-calorie diet
E) High-protein diet

Answer: A, C, D, E

Explanation: A) A child with celiac disease who is underweight, vitamin-deficient, anemic, and experiencing diarrhea will require a low-fat diet.

B) In celiac disease, gastrointestinal dysfunction may cause carbohydrates to be incompletely digested, leading to malabsorption and intolerance.

C) Vitamin supplements are also likely required given that this child is vitamin deficient.

D) A child with celiac disease who is underweight, vitamin-deficient, anemic, and experiencing diarrhea will require a high-calorie diet.

E) A child with celiac disease who is underweight, vitamin-deficient, anemic, and experiencing diarrhea will require a high-protein diet.

Page Ref: 274

Cognitive Level: Applying

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 4.C. Analyze malabsorption disorders as they relate to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a malabsorption disorder.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with a malabsorption disorder.

6) Parents of a child diagnosed with celiac disease have requested guidance on how to implement an appropriate diet. In addition to a list of foods to include and exclude, which interventions by the nurse are appropriate? **Select all that apply.**
A) Obtaining a dietary prescription
B) Implementing a recommended exercise program
C) Training on how to read food labels
D) Providing a referral to support groups
E) Encouraging the use of a gluten-free cookbook
Answer: A, C, D, E
Explanation: A) Education that should be provided to the child and their family include obtaining a dietary prescription that will enable them to deduct the cost of special ingredients and commercially prepared products as a medical expense.
B) Exercise is not considered an intervention that is specifically aimed at treating celiac disease.
C) Education that should be provided to the child and their family includes education on how to read a food label.
D) Education that should be provided to the child and their family includes referrals to a support group.
E) Education that should be provided to the child and their family includes encouraging the use of a gluten-free cookbook.
Page Ref: 275
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 4.C. Analyze malabsorption disorders as they relate to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a malabsorption disorder.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with a malabsorption disorder.

7) The nurse is providing care to a pediatric client diagnosed with celiac disease. Which outcomes can be anticipated when the appropriate steps for managing celiac disease have been implemented? **Select all that apply.**

A) The client is free of abdominal discomfort including bloating, gas, indigestion, nausea, and vomiting.
B) The client is able to maintain normal or routine bowel habits.
C) The client has diarrhea fewer than 3 days weekly.
D) The client is able to maintain adequate nutritional status.
E) The client is able to make appropriate menu choices prior to discharge.

Answer: A, B, D, E

Explanation: A) When the client with celiac disease is placed on a gluten-free diet, treatment generally is successful, as long as the client avoids gluten totally. Symptoms such as diarrhea and abdominal discomfort should be eliminated.
B) When the client with celiac disease is placed on a gluten-free diet, treatment generally is successful, as long as the client avoids gluten totally. Symptoms such as diarrhea and abdominal discomfort should be eliminated.
C) Symptoms such as diarrhea should be eliminated.
D) Nutritional status should improve.
E) The client should be able to make menu choices to prevent symptoms associated with celiac disease.

Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 4.C. Analyze malabsorption disorders as they relate to digestion. Apply the nursing process in providing culturally competent care to an individual with a malabsorption disorder.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with a malabsorption disorder.

8) A client expresses the desire to become pregnant and asks how a gluten-free diet might help. Which information should the nurse question as a benefit of a gluten free diet for this client?
A) A gluten-free diet may lower the risk of infertility.
B) A gluten-free diet may lower the risk of miscarriage.
C) A gluten-free diet may increase the probability that the child's birth weight will be healthy.
D) A gluten-free diet may improve fetal bone development.
Answer: D
Explanation: A) Research suggests that female infertility is linked to celiac disease.
B) Women with celiac disease are at increased risk for miscarriage.
C) Low infant birth weight is also more prevalent among mothers with celiac disease than among the general population.
D) Calcium is critical for fetal bone development, and pregnant women should consume around 1000 mg of calcium per day, but this is a separate issue from maintaining a gluten-free diet.
Page Ref: 279
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2. Learning Outcome: 4.C. Analyze malabsorption disorders as they relate to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a malabsorption disorder.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with a malabsorption disorder.

9) The nurse is asked to describe the role of gluten in celiac disease. Which response will the nurse make?
A) It acts as a toxin damaging the villi of the small intestine.
B) It acts as an immunological body to destroy pathogens.
C) It acts as a virus to cause disease.
D) It acts as a substance that causes a sensitivity reaction.
Answer: D
Explanation: A) Gluten does not act like a toxin.
B) Gluten does not act like an immunological body to destroy pathogens.
C) Gluten does not act like a virus.
D) Gluten acts as a substance that causes a sensitivity reaction.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 4.C. Analyze malabsorption disorders as they relate to digestion. Describe the pathophysiology of malabsorption disorders.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with a malabsorption disorder.

Exemplar 4.D Pancreatitis

1) The nurse is providing care to a client admitted with acute pancreatitis. Which data support the client's diagnosis? **Select all that apply.**
A) Severe epigastric pain
B) Nausea and vomiting
C) Elevated temperature
D) Hypotension
E) Steatorrhea
Answer: A, B, C, D
Explanation: A) Acute pancreatitis presents with severe epigastric pain.
B) Acute pancreatitis presents with nausea and vomiting.
C) Acute pancreatitis presents with an elevated temperature.
D) Acute pancreatitis presents with hypotension.
E) Steatorrhea is a clinical manifestation that is associated with chronic pancreatitis.
Page Ref: 282
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.D. Analyze pancreatitis as it relates to digestion. Identify the clinical manifestations of pancreatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pancreatitis.

2) The nurse is providing care to a client who is being admitted to rule out acute pancreatitis. Which condition in the history increases the client's risk for this disease process?
A) Systemic lupus
B) Alcoholism
C) Cystic fibrosis
D) Hypertriglyceridemia
Answer: B
Explanation: A) Systemic lupus is a risk factor for chronic pancreatitis.
B) Alcoholism is a risk factor for acute pancreatitis.
C) Cystic fibrosis is a risk factor for chronic pancreatitis.
D) Hypertriglyceridemia is a risk factor for chronic pancreatitis.
Page Ref: 281
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.D. Analyze pancreatitis as it relates to digestion. Compare the risk factors and prevention of pancreatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pancreatitis.

3) An older client is diagnosed with chronic pancreatitis. Which information should the nurse include in this client's discharge teaching? **Select all that apply.**
A) Encourage a high-fat diet
B) Eliminate alcoholic beverages
C) Take pancrelipase as prescribed
D) Report symptoms of infection
E) Take antacids
Answer: B, C, D, E
Explanation: A) The client should be taught to follow a low-fat diet.
B) Appropriate teaching for a client diagnosed with chronic pancreatitis includes eliminating alcoholic beverages.
C) Appropriate teaching for a client diagnosed with chronic pancreatitis includes taking pancrelipase as prescribed.
D) The client should report any symptoms of infection (high fever, pain, rapid pulse, malaise).
E) Appropriate teaching for a client diagnosed with chronic pancreatitis includes the importance of taking antacids to prevent the destruction of the enzymes by hydrochloric acid.
Page Ref: 283
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 4.D. Analyze pancreatitis as it relates to digestion. Apply the nursing process in providing culturally competent care to an individual with pancreatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pancreatitis.

4) An adult client is admitted to the emergency department with symptoms of acute pancreatitis. Which problems should the nurse identify for this client? **Select all that apply.**

A) Acute pain
B) Impaired swallowing
C) Fluid volume deficiency
D) Nausea
E) Undernutrition

Answer: A, C, D, E

Explanation: A) Acute pancreatitis develops suddenly, typically with an abrupt onset of continuous severe epigastric and abdominal pain.
B) Impaired swallowing is not associated with pancreatitis.
C) Systemic complications of acute pancreatitis include intravascular volume depletion.
D) Other manifestations of acute pancreatitis include nausea and vomiting.
E) Nausea and vomiting can cause imbalanced nutrition.

Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Diagnosis

Learning Outcome: 4.D. Analyze pancreatitis as it relates to digestion. Apply the nursing process in providing culturally competent care to an individual with pancreatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pancreatitis.

5) An older adult client with a history of alcohol abuse is diagnosed with acute pancreatitis. For which treatment options should the nurse plan when caring for this client? **Select all that apply**.
A) Opioid analgesics
B) High-fat diet
C) Total parenteral nutrition
D) Nasogastric tube to suction
E) Pancrelipase administration
Answer: A, C, D
Explanation: A) Opioid analgesics are often necessary for the acute pain experienced by the client.
B) A client admitted with acute pancreatitis will be NPO until serum amylase levels have returned to normal, bowel sounds are present, and pain disappears.
C) Total parenteral nutrition is initiated.
D) A nasogastric tube is inserted and connected to suction.
E) Pancrelipase is prescribed for clients with chronic pancreatitis, not acute pancreatitis.
Page Ref: 284
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.D. Analyze pancreatitis as it relates to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with pancreatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pancreatitis.

6) An older client is diagnosed with chronic pancreatitis. Which treatment should the nurse expect to increase the client's risk for edema?
A) Pancrelipase administration
B) IV fluid administration
C) Nasogastric tube insertion
D) Total parenteral nutrition
Answer: B
Explanation: A) Pancrelipase does not increase the risk of edema.
B) Aggressive use of IV fluids to maintain vascular volume is more likely to lead to edema in older adults and may not have the desired effect on renal function.
C) A nasogastric tube will not increase the risk of edema.
D) Total parenteral nutrition will not increase the risk of edema.
Page Ref: 284
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 4.D. Analyze pancreatitis as it relates to digestion. Differentiate care of patients with pancreatitis across the lifespan.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pancreatitis.

7) A client was discharged after hospitalization for acute pancreatitis with instructions on the use of analgesics, cautions on the importance of avoiding alcohol and smoking, and recommendations for a low-fat diet. Which outcomes would indicate that the client has implemented the recommendations? **Select all that apply.**
A) The client experiences reduction or elimination of pain.
B) The client is free from alterations in nutritional status.
C) The client remains free from alterations in fluid balance.
D) The client returns to work.
E) The client is free from nausea.
Answer: A, B, C, E
Explanation: A) Indications that would suggest that the client has implemented the recommendations include a reduction or elimination of pain.
B) Indications that would suggest that the client has implemented the recommendations include freedom from alterations in nutritional status.
C) Indications that would suggest that the client has implemented the recommendations include freedom from alterations in fluid balance.
D) Employment is not an evaluative measure for managing acute pancreatitis.
E) Indications that would suggest that the client has implemented the recommendations include freedom from nausea.

Learning Outcome: 4.D. Analyze pancreatitis as it relates to digestion. Apply the nursing process in providing culturally competent care to an individual with pancreatitis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pancreatitis.

WwW.TeSt-Ws

8) A 28-year-old pregnant client presents with epigastric pain, back pain, anorexia, nausea, vomiting, and jaundice. Which diagnostic test should the nurse expect to be prescribed to determine the presence of gallstones?

A) Ultrasonography
B) Endoscopic retrograde cholangiopancreatography (ERCP)
C) Contrast-enhanced CT scan
D) Percutaneous fine-needle aspiration biopsy

Answer: A

Explanation: A) Sonography is the imaging method of choice in pregnant clients because it is safe for the fetus and has a high sensitivity to gallstones.
B) An ERCP is not used to diagnose gallstones in a pregnant client.
C) A CT scan with contrast is not used to diagnose gallstones in a pregnant client.
D) A percutaneous fine-needle aspiration biopsy is not used to diagnose gallstones in a pregnant client.

Page Ref: 285

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 4.D. Analyze pancreatitis as it relates to digestion. Differentiate care of patients with pancreatitis across the lifespan.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pancreatitis.

9) The nurse is creating a teaching tool about acute pancreatitis. Which characteristic should the nurse emphasize in this tool?
A) The pancreas attacks its own tissue.
B) The pancreas becomes distended with fluid.
C) The pancreas ceases to produce enzymes.
D) The pancreas needs to be removed.
Answer: A
Explanation: A) Regardless of the precipitating factor, the pathophysiologic process of acute pancreatitis begins with the release of activated pancreatic enzymes into pancreatic tissue. Activated proteolytic enzymes, trypsin in particular, digest pancreatic tissue and activate other enzymes such as phospholipase A, which digests cell membrane phospholipids, and elastase, which digests the elastic tissue of blood vessel walls.
B) The problem is not distension of the pancreas with fluid.
C) The problem is not the cessation of enzyme production.
D) The problem is not the pancreas needing to be removed.
Page Ref: 281
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 4.D. Analyze pancreatitis as it relates to digestion. Describe the pathophysiology of pancreatitis.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pancreatitis.

Exemplar 4.E Pyloric Stenosis

1) The nurse is providing care to a 1-month-old infant who is brought to the pediatric clinic for projectile vomiting. Which data collected during the assessment process would support the diagnosis of pyloric stenosis? **Select all that apply.**
A) Blood-tinged vomit
B) Low-grade fever
C) Persistent hunger
D) Peristaltic wave
E) Consistent weight gain
Answer: A, C, D
Explanation: A) The vomit can be blood-tinged in pyloric stenosis.
B) A low-grade fever is not expected.
C) Persistent hunger is a symptom of pyloric stenosis.
D) A peristaltic wave occurs in pyloric stenosis.
E) The infant may lose weight due to pyloric stenosis.
Page Ref: 287
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.E. Analyze pyloric stenosis as it relates to digestion. Identify the clinical manifestations of pyloric stenosis.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pyloric stenosis.

2) A new mother is concerned that a newborn is at risk for pyloric stenosis because the spouse had the condition at birth. Which response should the nurse make?

A) "Your baby has a greater risk for the condition due to a familial history."

B) "Your baby would have an increased risk if the infant was a girl."

C) "Due to your age, your son is at an increased risk for the condition."

D) "As long as your baby has bowel movements there is nothing to worry about."

Answer: A

Explanation: A) The infant is at a greater risk for developing pyloric stenosis because of the familial history.

B) Pyloric stenosis is more common in males than females.

C) The mother's age is not correlated with an increased risk of pyloric stenosis.

D) While bowel movements are important, this is not indicative of not having pyloric stenosis.

Page Ref: 287

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 4.E. Analyze pyloric stenosis as it relates to digestion. Compare the risk factors and prevention of pyloric stenosis.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pyloric stenosis.

3) The nurse is caring for an infant who is admitted for possible pyloric stenosis. Which actions will the nurse take when assessing this client? **Select all that apply.**
A) Observe the infant's abdomen.
B) Auscultate bowel sounds.
C) Provide oral feeding.
D) Palpate the right upper quadrant of the abdomen.
E) Pass a nasogastric tube.
Answer: A, B, D
Explanation: A) During the assessment of an infant suspected of having pyloric stenosis, the nurse will observe the infant's abdomen for a peristaltic wave.
B) During the assessment of an infant suspected of having pyloric stenosis, the nurse will auscultate the bowel sounds.
C) Providing oral feedings is not a part of the assessment.
D) During the assessment of an infant suspected of having pyloric stenosis, the nurse will palpate the right upper quadrant of the abdomen for an olive-shaped mass.
E) Inserting a nasogastric tube would not be done during the assessment.
Page Ref: 288

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Client/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.E. Analyze pyloric stenosis as it relates to digestion. Apply the nursing process in providing culturally competent care to an individual with pyloric stenosis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pyloric stenosis.

4) The nurse is caring for an infant who is scheduled for surgery for pyloric stenosis. When planning the infant's care, which problems will be noticed? **Select all that apply**.
A) Fluid volume deficiency
B) Hyperbilirubinemia related to poor liver function
C) Sleep disturbance of infant and parents
D) Anxiety in parents
E) Undernutrition
Answer: A, C, D, E
Explanation: A) The client will have a fluid volume deficiency due to poor intake and vomiting.
B) Jaundice is not a clinical manifestation of pyloric stenosis.
C) The client will have a sleep disturbance due to discomfort and hunger.
D) The parents will be anxious because the newborn will have surgery.
E) The client will have undernutrition because of vomiting.
Page Ref: 288
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Client/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Diagnosis
Learning Outcome: 4.E. Analyze pyloric stenosis as it relates to digestion. Apply the nursing process in providing culturally competent care to an individual with pyloric stenosis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pyloric stenosis.

5) The nurse is caring for an infant postsurgery for pyloric stenosis. Which nursing interventions are appropriate when caring for this infant? **Select all that apply.**

A) Administer analgesics, per order.

B) Instruct the parents on proper diapering to avoid pressure over the incision.

C) Encourage swaddling and rocking to facilitate relaxation.

D) Teach the parents to remove the Steri-Strips during the infant's first bath postsurgery.

E) Monitor temperature once per shift.

Answer: A, B, C

Explanation: A) Nursing interventions for an infant postsurgery for pyloric stenosis include administering analgesics as prescribed.

B) The parents should be instructed on diapering to avoid pressure on the incision.

C) The parents should be encouraged to swaddle and rock the infant to aid in relaxation.

D) The parents should be taught to allow the Steri-Strips to come off on their own.

E) The infant's temperature should be monitored every 4 hours due to the increased risk for infection.

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 4.E. Analyze pyloric stenosis as it relates to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with pyloric stenosis.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pyloric stenosis.

6) The nurse is providing care to an infant who underwent surgery for pyloric stenosis. Which actions by the nurse will decrease the risk for infection when caring for this infant? **Select all that apply.**
A) Monitor temperature every hour.
B) Place pressure on the incision.
C) Inspect the incision for redness, swelling, or discharge.
D) Auscultate the lungs to assess for any adventitious sounds.
E) Give the infant a tub bath.
Answer: C, D
Explanation: A) The nurse should monitor the infant's temperature every 4 hours.
B) Pressure should be avoided on the incision.
C) The incision should be inspected for redness, swelling, or discharge.
D) The infant's lungs should be auscultated to assess for adventitious breath sounds.
E) The infant should be provided with a sponge bath until the surgical incision has healed.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 4.E. Analyze pyloric stenosis as it relates to digestion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with pyloric stenosis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pyloric stenosis.

7) The nurse is caring for an infant recovering from a laparoscopic pyloromyotomy. Which statements indicate that teaching provided to the parents about postoperative care were effective? **Select all that apply.**
A) "I will burp my baby every 1-2 ounces during feedings."
B) "It is important to slide the diaper under my baby when changing the diaper."
C) "I will feed my baby 3 times per day."
D) "I will hold my baby in an upright position for 15 minutes after each feeding."
E) "I will clean the incision site with warm, soapy water twice per day."
Answer: A, B
Explanation: A) Appropriate care for an infant after a laparoscopic pyloromyotomy includes burping the infant after every 1-2 ounces of formula.
B) Appropriate care for an infant after a laparoscopic pyloromyotomy includes sliding the diaper under the baby versus pulling on the legs in order to decrease the pressure on the incision site.
C) The baby should be fed on demand, not three times per day.
D) The infant should be held upright for 30 minutes after each feeding.
E) The incision site should be kept clean and dry.

Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 4.E. Analyze pyloric stenosis as it relates to digestion. Apply the nursing process in providing culturally competent care to an individual with pyloric stenosis.
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pyloric stenosis.

8) An adult client is diagnosed with adult pyloric stenosis. Which finding would be unexpected when assessing this client?

A) Weight loss
B) Upper abdominal pain
C) Increase of appetite
D) Nausea

Answer: C

Explanation: A) Symptoms of adult pyloric stenosis include weight loss.
B) Symptoms of adult pyloric stenosis include gradual increase of upper abdominal pain.
C) Symptoms of adult pyloric stenosis include easy satiety and loss of appetite.
D) Nausea and vomiting is common.

Page Ref: 287

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 4.E. Analyze pyloric stenosis as it relates to digestion. Differentiate care of patients with pyloric stenosis across the lifespan.

MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pyloric stenosis.

9) The nurse is reviewing information received during hand-off communication. Which client is most likely to develop adult pyloric stenosis?
A) 11-year-old female client with acute pancreatitis
B) 22-year-old male client with acute hepatitis B
C) 33-year-old female client with GERD
D) 44-year-old male client with gastritis
Answer: D
Explanation: A) An 11-year-old client would not develop an adult form of the condition.
B) Acute hepatitis B is not a risk factor for pyloric stenosis in an adult.
C) Adult pyloric stenosis is more common in male clients.
D) The 44-year-old male client, because of the age, gender, and complaint of gastritis, is the most likely of these clients to develop adult pyloric stenosis. Although adult pyloric stenosis is uncommon, it occurs most commonly in middle-aged men. When it does occur in adults, pyloric stenosis may be classified as primary or secondary. The primary type can occur without an apparent cause. The secondary type is the result of other problems in the GI tract such as ulcer, hernia, a malignancy, or gastritis.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 4.E. Analyze pyloric stenosis as it relates to digestion. Differentiate care of patients with pyloric stenosis across the lifespan.
WW.TBSM.WS
MNL LO: Demonstrate understanding of the concept of digestion in the care of a patient with pyloric stenosis.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e (Pearson)
Module 5 Elimination

The Concept of Elimination

1) An older adult reports poor sleep because of the need to void several times during the night. Which statement about the bladder should the nurse make to explain nocturia to this client?
A) "As you get older, there is a decrease in number of nephrons."
B) "As you get older, there is a decrease in the blood supply to your bladder."
C) "As you get older, you may have a decreased bladder capacity."
D) "As you get older, there is a decrease in cardiac output, causing these symptoms."
Answer: C
Explanation: A) A decrease in the number of nephrons in the kidney decreases the filtration rate.
B) Blood flow to the kidney decreases as a result of arteriosclerosis and renal artery atherosclerosis.
C) With aging, the bladder becomes more fibrous, with a consequent decrease in storing capacity and increase in residual urine. The decrease in autonomic regulation of the bladder by the nervous system with aging affects contraction of both the detrusor muscle and the external sphincter.
D) A decrease in cardiac output decreases peripheral circulation, which would decrease urinary output day or night.
Page Ref: 308
Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.6. Differentiate considerations related to the assessment and care of patients with alterations in urinary elimination throughout the lifespan.
MNL LO: Analyze the concept of elimination and its application to nursing care.

2) A client with high blood pressure that is not responding to medications is suspected of having renal stenosis. Which location will the nurse auscultate when assessing for this condition?
A) Renal arteries
B) Bladder
C) Ureters
D) Internal urethral sphincter
Answer: A
Explanation: A) The nurse should auscultate the renal arteries by placing the bell of the stethoscope lightly in the areas of the renal arteries, located in the left and right upper abdominal quadrants. Systolic bruits ("whooshing" sounds) may indicate renal artery stenosis.
B) The bladder does not contain the renal arteries.
C) The ureters are not the locations to assess for renal stenosis.
D) The internal urethral sphincter is not the location to assess for renal stenosis.
Page Ref: 302
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.1. Analyze the physiology of urinary elimination in the body.
MNL LO: Analyze the concept of elimination and its application to nursing care.

3) The nurse is caring for a group of clients on a medical-surgical unit. Which client should the nurse anticipate to be at the greatest risk for alterations in urinary elimination?
A) The client with hypertension who takes a diuretic to manage blood pressure
B) An 80-year-old male client reporting frequent urination at night
C) A 25-year-old female client with low self-esteem
D) A client who had bladder cancer and now has a newly created ileal conduit
Answer: B
Explanation: A) The client with high blood pressure takes medication to remove excess fluid from the body, and as long as urine elimination increases, there should be no problems.
B) The client who is 80 years old with frequent urination at night may be having problems with his prostate. Older male adults experience urinary retention due to prostate enlargement, causing an alteration in urinary elimination.
C) The 25-year-old experiencing low self-esteem has a psychological problem and will need therapy to find the root of the problem.
D) The client who had bladder cancer and now has an ileal conduit doesn't have kidney damage, only the bladder removed. Continued urine production through the ileal conduit will need to be observed and assessed frequently by the staff.
Page Ref: 295
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.6. Differentiate considerations related to the assessment and care of patients with alterations in urinary elimination throughout the lifespan.
MNL LO: Analyze the concept of elimination and its application to nursing care.

4) The nurse is caring for a client with a history of urinary tract infections (UTIs). Which action should the nurse take to help decrease the risk of the client experiencing future UTIs?
A) Instruct the client to avoid delaying urination.
B) Tell the client to increase caffeine in the diet.
C) Encourage the client to use the pelvic floor muscles to force urine flow.
D) Remind the client to wipe from back to front.
Answer: A
Explanation: A) Suppressing urination increases the risk of urinary tract infections.
B) The client should decrease the use of caffeine in the diet because caffeine is a bladder irritant.
C) The pelvic floor muscles should not be used to force urine flow and doing so is considered a poor toileting habit.
D) The client should wipe from front to back because wiping from back to front would contaminate the urinary meatus.
Page Ref: 295
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.2. Differentiate alterations in urinary elimination.
MNL LO: Analyze the concept of elimination and its application to nursing care.

5) The nurse admits a client to the medical unit for a urinary disorder. Which questions should the nurse ask when assessing the client's voiding pattern? **Select all that apply.**

A) How many times do you urinate in a 24-hour period?
B) Has your pattern of urination changed recently?
C) How often do you get out of bed at night to urinate?
D) What color is your urine?
E) Does your urine have any type of odor?

Answer: A, B, C

Explanation: A) When assessing the client's voiding pattern, it is appropriate for the nurse to ask how many times the client voids in a 24-hour period.
B) When assessing the client's voiding pattern, it is appropriate for the nurse to ask if the pattern of urination has changed recently.
C) When assessing the client's voiding pattern, it is appropriate for the nurse to ask how often the client gets out of bed at night to urinate.
D) Questions regarding the color of urine is appropriate when assessing urine characteristics.
E) Questions regarding the odor of urine is appropriate when assessing urine characteristics.

Page Ref: 297
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 5.3. Differentiate common assessment procedures and tests used to examine urinary elimination.
MNL LO: Analyze the concept of elimination and its application to nursing care.

6) The nurse suspects a client has a urinary tract infection. Which urinalysis result supports the nurse's suspicions?
A) pH 5.2
B) Negative glucose
C) WBC 10-15
D) Specific gravity 1.012
Answer: C
Explanation: A) The pH is between 4.5 and 8.
B) There should be no glucose in the urine.
C) A normal WBC is 3-4. The WBC count for this client is high and indicates infection.
D) The specific gravity should be between 1.005 and 1.030.
Page Ref: 300
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.3. Differentiate common assessment procedures and tests used to examine urinary elimination.
MNL LO: Analyze the concept of elimination and its application to nursing care.

7) The nurse is providing care to a client who is experiencing urinary incontinence. Which independent nursing intervention is the most appropriate for this client?
A) Encouraging increased fluid intake
B) Providing catheter care
C) Instructing on self-catheterization
D) Teaching hygiene care
Answer: D
Explanation: A) Encouraging increased fluid intake is appropriate for a client who is dehydrated.
B) Providing catheter care is appropriate for a client who is diagnosed with urinary retention.
C) Instructing on self-catheterization is appropriate for a client who is diagnosed with urinary retention.
D) Clients with urinary incontinence must be taught hygiene care–sometimes called incontinence care–to protect against tissue breakdown.
Page Ref: 303
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.8 Promote self-care management. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 5.4. Analyze independent interventions nurses can implement for patients with alterations in urinary elimination.
MNL LO: Analyze the concept of elimination and its application to nursing care.

8) The nurse is assigned to a postpartum client who had an anesthetic block during labor and delivery. When providing care for this client, which should the nurse anticipate?
A) Nocturnal enuresis
B) Risk for hyperkalemia
C) Residual urine
D) Glycosuria
Answer: C
Explanation: A) Nocturnal enuresis would be anticipated for older adult clients.
B) Risk for hyperkalemia would be anticipated for older adult clients.
C) The postpartum woman is at risk for overdistention, incomplete bladder emptying, and buildup of residual urine (urine that remains in the bladder after voiding).
D) Glycosuria is expected for a client during pregnancy, not during the postpartum period.
Page Ref: 307
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 5.6. Differentiate considerations related to the assessment and care of patients with alterations in urinary elimination throughout the lifespan.
MNL LO: Analyze the concept of elimination and its application to nursing care.

9) A client with urinary urgency is prescribed an anticholinergic medication. Which teaching should the nurse provide to this client?

A) "This medication must be taken on an empty stomach."

B) "You will need to discontinue the medication when your symptoms subside."

C) "This medication causes constipation. You should take a laxative every day."

D) "It is important to notify the healthcare provider if you experience urinary retention."

Answer: D

Explanation: A) There is no specific information regarding if this medication needs to be taken on an empty stomach.

B) Clients should always check with their healthcare provider before stopping any medication, because there could be some major complications

C) Constipation has been reported but a laxative should not be taken every day, as one can become dependent.

D) Anticholinergics can cause urinary retention; therefore, it would be important for the client to notify the healthcare provider if this occurs.

Page Ref: 304

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 5.5. Summarize collaborative therapies used by interprofessional teams for patients with alterations in urinary elimination.

MNL LO: Analyze the concept of elimination and its application to nursing care.

10) The nurse is providing care to a client who is experiencing urinary retention. Which diagnostic tool should the nurse anticipate being ordered for this client?
A) Ultrasonic bladder scan
B) Urinalysis
C) Intravenous pyelography (IVP)
D) Cystoscopy
Answer: A
Explanation: A) An ultrasonic bladder scan is the diagnostic test that is used to examine for residual urine.
B) A urinalysis is often used to monitor the urine for infection.
C) An IVP is used to diagnosis a kidney stone.
D) A cystoscopy allows direct visualization of the bladder wall and urethra. It is often used to remove stones.
Page Ref: 299
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 5.3. Differentiate common assessment procedures and tests used to examine urinary elimination.
MNL LO: Analyze the concept of elimination and its application to nursing care.

11) The nurse is conducting education regarding urinary health at an assisted living facility. Which topics should the nurse include for this population? **Select all that apply.**
A) Full urinary control usually occurs at 4 or 5 years of age.
B) Due to neuromuscular immaturity in infancy, voluntary urinary control is absent.
C) The kidneys reach maximum size between 35 and 40 years of age.
D) Renal blood flow decreases because of vascular changes and a decrease in cardiac output.
E) Urinary incontinence may occur because of mobility problems or neurological impairments.
Answer: D, E
Explanation: A) Full urinary control is not an appropriate topic for an older population.
B) Neuromuscular maturity in infancy is not an appropriate topic for an older population.
C) Size of the kidneys is not an appropriate topic for an older population.
D) When planning an education session regarding urinary health at an assisted living facility, the nurse would include information that affects the urinary health of the older adult client. Information that is appropriate for the nurse to consider is the decrease in renal blood flow due to vascular changes.
E) When planning an education session regarding urinary health at an assisted living facility, the nurse would include information that affects the urinary health of the older adult client. Information that is appropriate for the nurse to consider is that urinary incontinence may occur because of issues with mobility and neurological impairment.
Page Ref: 308
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 5.6. Differentiate considerations related to the assessment and care of patients with alterations in urinary elimination throughout the lifespan.
MNL LO: Analyze the concept of elimination and its application to nursing care.

12) The nurse is providing care to newborns in the nursery. When assessing the newborns' urinary output, which should the nurse anticipate as normal daily urinary output?
A) 15-60 mL
B) 100-300 mL
C) 250-450 mL
D) 400-500 mL
Answer: A
Explanation: A) Normal urinary output for the newborn at 1-2 days of age is 15-60 mL per day.
B) Normal urinary output for a newborn 3 to 10 days of age is 100-300 mL per day.
C) The normal output for the newborn at 10 days of age to the infant at 2 months of age is 250-400 mL per day.
D) Normal output for an infant at 2 months of age through 1 year is 400-500 mL per day.
Page Ref: 307
Cognitive Level: Remembering
Client Need/Sub: Health Promotion and Maintenance

Learning Outcome: 5.6. Differentiate considerations related to the assessment and care of patients with alterations in urinary elimination throughout the lifespan.
MNL LO: Analyze the concept of elimination and its application to nursing care.

13) The nurse is observing a graduate nurse assess a client's abdomen. For which actions should the nurse intervene? **Select all that apply.**
A) Performing palpation before auscultation
B) Performing auscultation before palpation
C) Using inspection, auscultation, percussion, and palpation during the abdominal assessment of the client
D) Using only inspection, percussion, and palpation during the abdominal assessment of the client
E) Using deep palpation during the assessment process
Answer: A, D, E
Explanation: A) Auscultation should precede palpation, because palpation can alter peristalsis.
B) Auscultation should precede palpation, because palpation can alter peristalsis.
C) Physical examination of the abdomen includes inspection, auscultation, percussion, and palpation.
D) Physical examination of the abdomen includes inspection, auscultation, percussion, and palpation.
E) Never use deep palpation on a client who has an abdominal mass, renal transplant, or polycystic kidneys, or who is at risk for hemorrhage.
Page Ref: 315
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 5.9. Differentiate common assessment procedures and tests used to examine bowel elimination.
MNL LO: Analyze the concept of elimination and its application to nursing care.

14) The client is experiencing urinary urgency and frequency. Which medication should the nurse anticipate being prescribed by the healthcare provider?
A) Furosemide
B) Bumetanide
C) Oxybutynin
D) Bethanechol chloride
Answer: C
Explanation: A) Furosemide is a diuretic and works in a specific place within the nephron to increase fluid excretion and prevent fluid reabsorption.
B) Bumetanide is a diuretic and works in a specific place within the nephron to increase fluid excretion and prevent fluid reabsorption.
C) Oxybutynin is an anticholinergic that reduces urgency and frequency by blocking muscarinic receptors in the detrusor muscle of the bladder, thereby inhibiting contractions and increasing storage capacity.
D) Bethanechol chloride is a cholinergic agent that stimulates bladder contraction and facilitates voiding.
Page Ref: 304
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. MNL LO: Analyze the concept of elimination and its application to nursing care.

W W. T B S M. W S

15) The nurse is asked to explain the effect on stool when fluid intake is less than adequate. Which response will the nurse make?

A) It is drier and harder than normal.
B) It is more watery and more soft than normal.
C) It is more watery and harder than normal.
D) It is drier and more soft than normal.

Answer: A

Explanation: A) When fluid intake is inadequate or output is excessive, the passage of chyme slows and the absorption of fluid increases. The end result is feces that is harder and drier than normal.

B) Watery, soft feces is the result of rapid intestinal transit that leads to inadequate fluid absorption.

C) Watery and hard stool would not occur when fluid intake is inadequate.

D) Dry and soft stool would not occur when fluid is inadequate.

Page Ref: 309

Cognitive Level: Remembering

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 5.7. Analyze the physiology of bowel elimination in the body.

MNL LO: Analyze the concept of elimination and its application to nursing care.

16) Clients experiencing diarrhea often lose electrolytes. Which statement describes the reason for this loss?
A) Decreased secretion of intestinal mucus inhibits the absorption of electrolytes from the chyme by the intestine.
B) Pathogenic microorganisms that cause diarrhea consume the electrolytes in the chyme, resulting in fewer electrolytes being available for absorption.
C) Diarrhea causes rapid passage of chyme through the large intestine, reducing the time available for absorption of electrolytes.
D) Intestinal bacteria break down electrolytes during diarrhea and make them unfit for absorption by the intestine.
Answer: C
Explanation: A) Diarrhea typically increases secretion of intestinal mucus rather than decreasing it.
B) Pathogenic microorganisms result in inflammation of the mucosa.
C) Diarrhea causes rapid passage of chyme through the large intestine. This reduces the time available for the large intestine to absorb electrolytes and results in the electrolytes being lost with feces.
D) Bacteria in the intestine cannot break down electrolytes.
Page Ref: 310
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.8. Differentiate alterations in bowel elimination.
MNL LO: Analyze the concept of elimination and its application to nursing care.

17) A client presents in the emergency department exhibiting signs indicative of the onset of a bowel obstruction. Which bowel sounds should the nurse anticipate when auscultating the client's abdomen?

A) Gurgling or clicking sounds
B) High-pitched tinkling, rushing, or growling sounds
C) Absence of sounds
D) Continuous, medium-pitched hum

Answer: B

Explanation: A) Gurgling or clicking sounds are considered normal.

B) High-pitched tinkling, rushing, or growling bowel sounds–known as borborygmus–are indicative of the onset of bowel obstruction.

C) Absence of bowel sounds is indicative of late bowel obstruction, not onset of bowel obstruction.

D) A continuous, medium pitched hum–called a venous hum–is indicative of a cirrhotic liver.

Page Ref: 315

Cognitive Level: Understanding

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 5.9. Differentiate common assessment procedures and tests used to examine bowel elimination.

MNL LO: Analyze the concept of elimination and its application to nursing care.

18) A client presents with constipation even though using the abdominal muscles to aid with defecation. Which response should the nurse make?

A) "Try taking an over-the-counter medication containing bismuth salts, such as Kaopectate or Pepto-Bismol. If your symptoms don't subside in 2 days, come back to the office."

B) "Stop taking all medications until you have reestablished a normal elimination routine. Medication usage often leads to constipation."

C) "Make sure that you are taking proper care of the skin in the anal area. Skin breakdown can result in hesitancy when defecating."

D) "Try to avoid straining with the abdominal muscles during defecation. Doing so may actually close the anal sphincter, preventing feces from passing through."

Answer: D

Explanation: A) Bismuth salts are antidiarrheals–not laxatives–and would likely compound the client's problem.

B) Certain medications can lead to constipation in some clients, but it is not appropriate for the nurse to encourage the discontinuation of all medications.

C) Skin care is a concern for clients who are experiencing diarrhea or fecal incontinence and is not typically an issue for patients with constipation.

D) Clients should be instructed to use caution when straining the abdominal muscles during defecation, because it may close the anal sphincter rather than allowing feces to pass through.

Page Ref: 310, 313

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 5.10. Analyze independent interventions nurses can implement for patients with alterations in bowel elimination.

MNL LO: Analyze the concept of elimination and its application to nursing care.

19) The nurse is preparing to assess clients in the clinic experiencing problems with bowel elimination. Which client is most likely to have a daily stool softener added to the treatment regimen?
A) A 3-month-old client who is exclusively breastfed
B) A 43-year-old client who takes opioid medication for chronic pain
C) A 92-year-old client who experiences frequent leakage of feces from the anus
D) A 28-year-old client who is anemic and has blood in the stool
Answer: B
Explanation: A) Breastfed infants typically have soft, liquid stools and would not benefit from a stool softener.
B) Clients taking opioids have an increased risk of developing constipation and may prevent it by taking daily stool softeners.
C) Leakage of feces from the anus is indicative of bowel incontinence–not constipation–and would not be treated with a stool softener.
D) Anemia and blood in the stool are indicators of potential bowel cancer or other serious conditions; this client would likely undergo testing rather than be prescribed a stool softener.

MNL LO: Analyze the concept of elimination and its application to nursing care.

Exemplar 5.A Benign Prostatic Hyperplasia

1) The nurse is caring for a client diagnosed with benign prostatic hyperplasia (BPH) who is experiencing an increase in symptoms. Which statement by the client would best explain the source of the increased symptoms?
A) "I have decreased oral intake at night."
B) "I recently had a vasectomy."
C) "I am using an over-the-counter cold medication for a cold."
D) "I am drinking very little caffeine."
Answer: C
Explanation: A) Decreasing oral intake at night may resolve symptoms.
B) A vasectomy does not affect the symptoms of BPH.
C) Use of cold medications can increase symptoms because of their anticholinergic properties.
D) Avoiding caffeine may resolve symptoms.
Page Ref: 327

Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

2) The nurse is providing care to a client who is diagnosed with benign prostatic hyperplasia (BPH). Which information in the client's health history indicate a risk factor for this diagnosis? **Select all that apply.**
A) Excessive exercise
B) Decreased fluid intake
C) Diet high in milk
D) 70 years of age
E) African American ethnicity
Answer: D, E
Explanation: A) Excessive exercise does not cause BPH.
B) Decreasing oral intake does not cause BPH.
C) A diet high in milk does not cause BPH.
D) Although the exact cause is unknown, risk factors associated with BPH include increasing age.
E) The prevalence of BPH is similar in African American and white men, but it tends to be more severe and progressive in African American men.
Page Ref: 325

Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Compare the risk factors and prevention of BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

WwW.TeSM.Ws

3) A middle-aged male client who is experiencing urinary retention is experiencing symptoms of benign prostatic hyperplasia (BPH). Which information in the client's history should the nurse identify as a modifiable risk factor?
A) BMI 35
B) Plays tennis
C) Takes aspirin
D) Works full-time
Answer: A
Explanation: A) Obesity is a modified risk factor for BPH.
B) An active lifestyle is not a risk factor for BPH.
C) Taking aspirin is not a risk factor for BPH.
D) No specific employment is identified for the development of BPH.
Page Ref: 325
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Compare the risk factors and prevention of BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

4) The nurse is providing follow-up care for a client recently diagnosed with benign prostatic hyperplasia (BPH). Which problem should the nurse use to guide this client's plan of care?
A) Chronic pain
B) Impaired urinary function
C) Constipation
D) Diarrhea
Answer: B
Explanation: A) The client with BPH will experience acute pain.
B) The priority problem for a client diagnosed with BPH is impaired urinary function.
C) Clients with BPH have problems associated with urinary elimination, not bowel elimination.
D) Clients with BPH have problems associated with urinary elimination, not bowel elimination.
Page Ref: 329
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia. Apply the nursing process in providing culturally competent care to an individual with BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

5) A client recovering from prostate surgery will be ready for discharge within the next few days. Which teaching point should the nurse focus on for this client?

A) The client should not drive for 6 weeks after surgery.

B) The client should call the healthcare provider immediately for any bleeding.

C) The client should increase the intake of water.

D) The client should avoid heavy lifting for 2 weeks after surgery.

Answer: C

Explanation: A) The client may not drive for 2 weeks after surgery.

B) The client is instructed to call the doctor for heavy bleeding, though minor bleeding when defecating, coughing, or exercising is normal.

C) The client should be encouraged to increase fluids to 8, 10 ounce glasses each day.

D) The client is taught to avoid heavy lifting for 4-8 weeks after discharge.

Page Ref: 332

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with BPH.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

6) A client is recovering from minimally invasive surgery to treat benign prostatic hyperplasia (BPH). After assessing the client, the nurse expects which outcome for this client?
A) Bowel continence
B) Absence of pain
C) No postoperative treatment
D) Urinary continence
Answer: D
Explanation: A) Most clients, due to pain and swelling in the area, may have problems with constipation immediately following the surgical intervention.
B) The client will experience some amount of discomfort after the procedure.
C) The client will need postoperative teaching.
D) After surgery and removal of the catheter, the client should return to urinary continence as expected.
Page Ref: 328
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia. Apply the nursing process in providing culturally competent care to an individual with BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

7) The nurse is providing care to a client who is diagnosed with mild benign prostatic hyperplasia (BPH). Which lifestyle change is appropriate for this client?
A) Increasing caffeine intake
B) Increasing alcohol intake
C) Perform pelvic floor exercises
D) Using over-the-counter antihistamines
Answer: C
Explanation: A) The client should eliminate caffeine from the diet.
B) The client should eliminate alcohol from the diet.
C) A client who is diagnosed with mild BPH should be instructed to perform pelvic floor exercises.
D) The client should avoid using over-the-counter antihistamines.
Page Ref: 327
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.8 Promote self-care management. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

8) The nurse instructs a client about the new diagnosis of benign prostatic hyperplasia (BPH). Which statement indicates to the nurse that the client needs further education?
A) "Alpha blockers can be used to control my symptoms."
B) "I know I will get cancer of the prostate because of this."
C) "As my condition progresses, I may need to consider surgical management."
D) "There are nonsurgical treatment options available."
Answer: B
Explanation: A) Alpha blockers will help control the symptoms.
B) BPH is a benign condition that is not considered a precursor to cancer. It is caused by an increase in size of the prostate gland and is seen in older males.
C) Surgery can be done to manage the condition.
D) There are nonsurgical treatments available, such as medication to shrink the gland.
Page Ref: 326
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Apply the nursing process in providing culturally competent care to an individual with BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

9) A client is diagnosed with benign prostatic hyperplasia (BPH). Which topics are appropriate for the nurse to include in the teaching session related to the client's condition? **Select all that apply.**
A) Self-care
B) Nutrition
C) Surgical approaches to treatment
D) Pharmacologic approaches to treatment
E) Permanent urinary catheterization
Answer: A, B, C, D
Explanation: A) When conducting teaching for a client who is diagnosed with BPH, the nurse will include information regarding self-care.
B) When conducting teaching for a client who is diagnosed with BPH, the nurse will include information regarding nutrition.
C) When conducting teaching for a client who is diagnosed with BPH, the nurse will include information regarding surgical approaches for treatment.
D) When conducting teaching for a client who is diagnosed with BPH, the nurse will include information regarding pharmacologic approaches for treatment.
E) Permanent urinary catheterization is not an appropriate topic to include in the teaching session.
Page Ref: 330
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Apply the nursing process in providing culturally competent care to an individual with BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

10) A client is concerned about developing benign prostatic hyperplasia (BPH). Which information in the client's history increases the risk for this condition?
A) Increased levels of testosterone
B) Increased levels of estrogen
C) 35 years of age
D) Circumcision at birth
Answer: B
Explanation: A) Elevated levels of testosterone prevent the development of BPH.
B) Clients with increased levels of estrogen are at an increased risk for developing BPH.
C) Clients younger than 40 years of age are at a decreased risk for BPH.
D) Circumcision does not impact the development of BPH.
Page Ref: 325
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Compare the risk factors and prevention of BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

11) The client admitted with benign prostatic hyperplasia (BPH) is prescribed an alpha-adrenergic blocker as treatment. When providing care to this client, which assessment is a priority related to this medication?
A) Blood pressure
B) Pain rating
C) Respiratory rate
D) Temperature
Answer: A
Explanation: A) Alpha-adrenergic blockers may cause first-dose phenomenon (severe hypotension and syncope) and tachycardia. When administering this medication to a client diagnosed with BPH, the priority assessment is the client's blood pressure.
B) Pain level is not a priority to assess for an alpha-adrenergic blocker.
C) Respiratory rate is not a priority to assess for an alpha-adrenergic blocker.
D) Temperature is not a priority to assess for an alpha-adrenergic blocker.
Page Ref: 328
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | Nursing Process: Assessment
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Summarize the diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

12) The nurse is planning care for a client with mild benign prostatic hyperplasia (BPH) who is experiencing urinary retention. Which goal is the most appropriate for this client?
A) The client will increase fluid intake to at least 2-3 liters daily.
B) The client lists over-the-counter medications to be avoided.
C) The client will voice an understanding of the importance of the use of antiembolic stockings and compression devices.
D) The client will use a T-binder or scrotal support properly.
Answer: B
Explanation: A) An increased fluid intake can assist in preventing burning on urination after catheter removal and reduces the risk of a urinary tract infection. There is no indication that this client had surgery or had a catheter placed.
B) Avoiding over-the-counter medications can lessen or prevent the symptoms associated with mild benign prostatic hyperplasia (BPH).
C) The use of antiembolic stockings and compression devices reduces the risk of developing a thromboembolism. There is no indication that this client had surgery or is at risk for developing a thromboembolism.
D) The use of a T-binder or scrotal support is for those clients that have undergone surgery and are in need of scrotal support and support of the surgical dressing. There is no indication that this client had surgery or had a catheter placed.
Page Ref: 329
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Apply the nursing process in providing culturally competent care to an individual with BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

13) A client with benign prostatic hyperplasia (BPH) experiences burning and difficulty when urinating. Based on this data, which problem is the priority for this client?
A) Potential for bleeding
B) Potential for fluid volume imbalance
C) Acute pain
D) Lack of knowledge
Answer: C
Explanation: A) There is no evidence the client is bleeding.
B) There is no evidence of a fluid volume imbalance.
C) The client is experiencing burning and other difficulties during urination. The burning indicates the client is experiencing pain and would indicate a problem of acute pain.
D) There is no evidence that the client lacks knowledge about the condition.
Page Ref: 329
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Apply the nursing process in providing culturally competent care to an individual with BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

14) The nurse is preparing a teaching tool about the pathophysiology of benign prostatic hyperplasia (BPH). Which statement should the nurse include that describes why benign prostatic hyperplasia is more common in older men than in younger men?
A) An increase in androgen production occurs with age, and increased androgens trigger prostatic growth.
B) Hyperplasia of stromal and epithelial cells in the prostate gland occurs over a long period of time.
C) A decrease in estrogen levels occurs over time and results in an increase in the size of the individual cells within the prostate.
D) Frequency of urinary tract infections increases with age, and frequent UTIs contribute to changes in the prostate.
Answer: B
Explanation: A) As men age, androgen production decreases rather than increases.
B) Hyperplasia is an increase in the number of cells; in the case of BPH, hyperplasia occurs in the cells of the prostate over a long period of time.
C) Estrogen levels increase with age rather than decreasing.
D) UTIs are often a result rather than a cause of BPH.
Page Ref: 325
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Describe the pathophysiology of BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

15) A client with BPH is experiencing urinary retention and bladder distention. Which action should the nurse anticipate to reduce the client's risk of developing diverticula, hydroureter, and hydronephrosis?
A) The enlarging mass of prostatic tissue must be reduced.
B) Straining during urination must be avoided.
C) Bladder pain must be managed.
D) The weak urinary stream must be strengthened.
Answer: A
Explanation: A) The enlarging mass contributes to distention of the bladder, so this is the most important issue to address to avoid diverticula, hydroureter, and hydronephrosis.
B) Straining during urination is associated with voiding rather than urinary retention and is less critical to avoiding complications.
C) Bladder pain is associated with storage rather than retention and should be addressed but is not critical to avoiding complications.
D) A weak stream is associated with voiding rather than urinary retention and is less critical to avoiding complications.
Page Ref: 326
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 5.A. Analyze benign prostatic hyperplasia (BPH) as it relates to elimination. Identify the clinical manifestations of BPH.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with benign prostatic hyperplasia.

Exemplar 5.B Bladder Incontinence and Retention

1) The nurse is providing care to a client who is diagnosed with stress incontinence. Which data would the nurse expect to collect during the client's health history and physical assessment? **Select all that apply**.
A) Urine leakage while talking
B) Urine leakage while coughing
C) Urine leakage while sneezing
D) Skin breakdown on the buttock
E) A urinary catheter
Answer: B, C, D
Explanation: A) Stress incontinence would not be caused by talking.
B) Stress incontinence involves a small leakage of urine when a client coughs.
C) Stress incontinence involves a small leakage of urine when a client sneezes.
D) If the client has been experiencing incontinence, the nurse might expect to see the skin inflamed and irritated because urine is very irritating to the skin.
E) A urinary catheter is not an expected finding.
Page Ref: 335
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Describe the etiology of bladder incontinence and retention.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

2) The nurse conducts education for a client who is experiencing urinary incontinence. Which statement by the client indicates the need for further education?
A) "Relaxation of pelvic muscles may be a factor in incontinence."
B) "Reduced urethral resistance can be a cause of incontinence."
C) "Incontinence is normal with aging."
D) "A disturbance of my bladder is a factor in the development of incontinence."
Answer: C
Explanation: A) Relaxation of the pelvic muscles is a potential factor in the development of incontinence.
B) Reduced urethral resistance is a potential factor in the development of incontinence.
C) Age is a risk factor for incontinence, but incontinence is not a normal result of aging.
D) A disturbance is a potential factor in the development of incontinence.
Page Ref: 334
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Compare the risk factors and prevention of bladder incontinence and retention.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

3) The nurse is caring for a client with urinary incontinence. Which information should the nurse include when instructing on bladder training?
A) Keep a bladder diary.
B) Plan to void every 6 hours.
C) Delay voiding when the urge occurs.
D) Avoid Kegel exercises when the urge occurs.
Answer: A
Explanation: A) Bladder training requires the client to postpone urination. The goal is to gradually lengthen the interval between voiding. The client should be instructed to keep a bladder diary to document the time, amount, leakage, or feelings of urgency.
B) For bladder training, the time should be gradually increased to 3 to 4 hours and not begin at 6 hours.
C) Voiding should not be delayed when the urge occurs.
D) Kegel exercises should be done when the urge occurs.
Page Ref: 338
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Apply the nursing process in providing culturally competent care to an individual with bladder incontinence or retention.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

4) A client has a problem of stress incontinence. Which outcome should the nurse plan for this client?

A) The client will stop the flow of urine when voiding.

B) The client will improve incontinence within 1 month.

C) The client will empty the bladder every time she voids.

D) The client will verbalize procedure for Kegel exercises.

Answer: D

Explanation: A) Clients are not instructed to stop the flow of urine when voiding, because this could lead to retention.

B) Improved continence takes 3-6 months, so 1 month is not a realistic goal.

C) Emptying the bladder completely every time voiding occurs would not be realistic in the beginning. This will take time.

D) Verbalizing the procedure for Kegel exercises is an appropriate goal for stress incontinence.

Page Ref: 343

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Apply the nursing process in providing culturally competent care to an individual with bladder incontinence or retention.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

5) A client has a history of chronic urinary tract infections. Which treatment should the nurse anticipate for the problem of urinary retention because of scarring?
A) Antibiotic therapy
B) An anticholinergic medication
C) Intermittent straight catheterization
D) Removal of bladder stones
Answer: C
Explanation: A) Antibiotic therapy is not indicated, as the client does not have an infection now.
B) Anticholinergic medications can cause urinary retention.
C) The healthcare provider may order straight catheterization so the client can be taught to self-catheterize and manage the urinary retention at home.
D) Bladder stones are not the problem; scarring is.
Page Ref: 341
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with bladder incontinence or retention.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

6) An older client reports urinary "accidents" and expresses frustration about this "normal part of aging." Which response should the nurse make?
A) "Tell me more about the incontinence you are experiencing."
B) "You may need to have surgery to manage this problem."
C) "I understand you are frustrated about this occurrence."
D) "Unfortunately, aging and incontinence go hand in hand."
Answer: A
Explanation: A) As the body ages, there are anatomic changes that can increase the risk for urinary incontinence; however, this is not a normal part of aging. It is appropriate for the nurse to gather more information regarding the client's incontinence.
B) It is beyond the nurse's scope of practice to recommend surgery to the client.
C) Telling the client that the nurse understands does not help to determine the cause of the client's incontinence.
D) Incontinence is not an accepted part of aging.
Page Ref: 342
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Compare risk factors and prevention of bladder incontinence and retention.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

7) The nurse is providing training for the clinical staff of a skilled care facility that primarily treats elderly clients. Which risk factors for functional incontinence will the nurse include in the training? **Select all that apply.**

A) Limited mobility
B) Impaired vision
C) Lack of access to facilities
D) Dementia
E) Urinary tract infection

Answer: A, B, C, D

Explanation: A) An immobilized client may experience incontinence if a call light is not within reach.
B) A client with impaired vision may not be able to find the bathroom.
C) Minimal facilities can create problems in urinary control.
D) A client with Alzheimer disease, along with other forms of dementia, may perceive the urge to void but be unable to interpret its meaning or respond by seeking a bathroom.
E) Urinary tract infection is not usually related to functional incontinence.

Page Ref: 336
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Differentiate care of patients with bladder incontinence and retention across the lifespan.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

8) The nurse is caring for a client with functional incontinence. Which conditions are factors in the development of this type of incontinence? **Select all that apply.**

A) Fecal impaction
B) Dementia
C) Confusion
D) Prostate surgery
E) Impaired mobility

Answer: B, C, E

Explanation: A) Fecal impaction is a contributing factor to overflow incontinence.

B) Functional incontinence occurs when the ability to respond to the need to urinate is impaired. Contributing factors may include dementia.

C) Functional incontinence occurs when the ability to respond to the need to urinate is impaired. Contributing factors may include confusion.

D) Prostate surgery is a contributing factor to stress incontinence.

E) Functional incontinence occurs when the ability to respond to the need to urinate is impaired. Contributing factors may include impaired mobility.

Page Ref: 336

Learning Outcome: 5.B. Analyze urinary incontinence and retention as they relate to elimination. Describe the etiology of bladder incontinence and retention.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

9) The nurse is reviewing discharge instructions for a client diagnosed with urinary incontinence. Which statement made by the client indicates the need for further education?
A) "I should drink plenty of water."
B) "I will avoid alcohol and coffee."
C) "I will get regular exercise."
D) "I will continue to hold my urine while in public."
Answer: D
Explanation: A) A client who is diagnosed with urinary should drink plenty of water spaced throughout the day to prevent urinary incontinence.
B) A client who is diagnosed with urinary incontinence should be instructed to avoid alcohol and caffeine.
C) A client who is diagnosed with urinary should be instructed to get regular exercise.
D) A client who is diagnosed with urinary incontinence should not hold the urine but rather empty the bladder when the urge occurs.
Page Ref: 335
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Apply the nursing process in providing culturally competent care to an individual with bladder incontinence or retention.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

10) The nurse is inserting an indwelling urinary catheter into an older adult male with an enlarged prostate. Which action should the nurse alter when inserting the catheter?
A) Injects 10 mL of 2% lidocaine gel into the client's urethra.
B) Inserts a 16 French coudé-tipped catheter.
C) Uses sterile technique to place the catheter.
D) Tapes the catheter to the leg
Answer: D
Explanation: A) Using 2% lidocaine gel 10 mL injected into the male urethra reduces discomfort during catheterization and the risk of catheter-associated infection, and it promotes pelvic muscle relaxation.
B) A coudé-tipped catheter is passed more easily in the older man with an enlarged prostate.
C) Sterile technique should always be used when inserting catheters.
D) The catheter should not be taped to the leg. It should be attached to a urinary drainage bag.
Page Ref: 344
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Differentiate care of patients with bladder incontinence and retention across the lifespan.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

11) The nurse at a health fair is educating clients on risk factors associated with urinary incontinence. Which risk factor should the nurse include as a nonmodifiable risk factor for urinary incontinence?
A) Age
B) Obesity
C) Smoking
D) Diabetes
Answer: A
Explanation: A) Age is a nonmodifiable risk factor and is a primary risk factor for the development of urinary incontinence; older individuals experience more frequent incontinence than younger individuals.
B) Age is a nonmodifiable risk factor and is a primary risk factor for the development of urinary incontinence; older individuals experience more frequent incontinence than younger individuals. Obesity is a modifiable risk factor for urinary incontinence.
C) Smoking is a modifiable risk factor for urinary incontinence.
D) Diabetes is a modifiable risk factor for urinary incontinence.
Page Ref: 335
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Compare the risk factors and prevention of bladder incontinence and retention.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

12) The nurse is caring for a client with urge incontinence. Which condition should the nurse recognize that contributes to the development of this type of incontinence?
A) Weakness of the urethra and surrounding tissue leading to decreased urethral resistance
B) Disruption to neuronal control of the sacral micturition centers due to tissue damage
C) An overactive detrusor muscle leading to increased pressure within the bladder
D) Outlet obstruction leading to the overfilling of the bladder and increased pressure
Answer: C
Explanation: A) Weakness of the urethra and surrounding tissue leading to decreased urethral resistance is a contributor to stress incontinence.
B) Disruption to neuronal control of the sacral micturition centers due to tissue damage is a contributor to reflex incontinence.
C) An overactive detrusor muscle leading to increased pressure within the bladder is a contributor to urge incontinence.
D) Outlet obstruction leading to the overfilling of the bladder and increased pressure is a contributor to overflow incontinence.
Page Ref: 335
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.B. Analyze bladder incontinence and retention as they relate to elimination. Identify the clinical manifestations of bladder incontinence and retention.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bladder incontinence and retention.

Exemplar 5.C Bowel Incontinence, Constipation, and Impaction

1) A client who ignores the urge to defecate states, "I don't like to have a bowel movement anywhere but at home." Which response by the nurse should the nurse make?
A) "This is a common practice, and it will strengthen the reflex later."
B) "You will get the urge later, so you should not worry about it."
C) "If you continue to ignore the urge to defecate, it can lead to problems."
D) "It is better to suppress the urge than to suffer embarrassment at work."
Answer: C
Explanation: A) Ignoring the urge will not strengthen the reflex later; it will weaken it.
B) When the urge to defecate is ignored, water continues to be reabsorbed, making the feces hard and difficult to expel.
C) When the normal defecation reflexes are inhibited, these conditioned reflexes tend to be progressively weakened. Ignoring the urge repeatedly will eventually cause the urge to be lost.
D) Embarrassment, while unwarranted, is preferable to losing the urge to defecate.
Page Ref: 347
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.C. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Describe the etiology of bowel incontinence, constipation, and impaction.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

2) A client in the ambulatory care clinic reports frequent constipation. Which statement about the client's diet would be of greatest concern for the nurse?
A) "I like to eat a bran muffin and applesauce every morning for breakfast."
B) "I like to eat popcorn for an afternoon snack."
C) "I like to eat cheese, a banana, and a turkey sandwich for lunch."
D) "I like to eat baked chicken, whole grain rolls, and a small salad for dinner."
Answer: C
Explanation: A) Bran muffins and applesauce will prevent constipation.
B) Popcorn would prevent constipation.
C) Both cheese and bananas are constipating foods that should be limited.
D) Whole grains and salad would prevent constipation.
Page Ref: 349
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.C. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Compare the risk factors and prevention of bowel incontinence, constipation, and impaction.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

3) An older adult client reports being constipated. Which response should the nurse make?
A) Encourage the client to increase fluid intake and activity.
B) Assess the client's intake of fiber and fluids.
C) Determine what the client means by constipation.
D) Obtain an order for a laxative and an enema from the physician.
Answer: C
Explanation: A) Increasing fluid intake and activity may be appropriate once the nurse has adequately assessed the client's concern of constipation.
B) Assessing the intake of fiber and fluids may be appropriate once the nurse has adequately assessed the client's concern of constipation.
C) Many older adults believe that a daily bowel movement is important for health, which leads to an increased incidence of perceived constipation in older adults. The nurse should first carefully evaluate the client's concern and question the person as to what is meant by constipation. Determining the client's normal frequency of bowel movements, consistency of stool, and effort in passing stool is important before deciding to act.
D) Laxatives and enemas may be appropriate once the nurse has adequately assessed the client's concern of constipation.
Page Ref: 352
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 5.C. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Differentiate care of patients with bowel incontinence, constipation, and impaction across the lifespan.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

4) The nurse is planning care for a newly admitted, bedbound, older adult client. Which problem should the nurse use to guide the care of this client?

A) Fecal incontinence

B) Low self-esteem

C) Diarrhea

D) Constipation

Answer: D

Explanation: A) Lack of sphincter control, not bedrest, contributes to fecal incontinence.

B) Low self-esteem would affect a client who has undergone a bowel diversion.

C) Diarrhea would come from a GI upset triggered by diseases, medication, or diet.

D) Lack of activity, like being bedbound, is a major contributor to constipation. Lack of movement slows bowel movements.

Page Ref: 356

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 5.C. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Apply the nursing process in providing culturally competent care to an individual with bowel incontinence, constipation, or impaction.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

5) The nurse instructs a client on dietary changes to reduce constipation. Which food selections by the client indicate that teaching has been effective? **Select all that apply.**
A) Rice
B) Carrot slices
C) Spinach salad
D) Bananas
E) Peas
Answer: B, C, E
Explanation: A) Rice is a constipating food.
B) Dietary fiber increases stool bulk. Carrots are an excellent source of dietary fiber.
C) Dietary fiber increases stool bulk. Spinach salad is an excellent source of dietary fiber.
D) Bananas are a constipating food.
E) Dietary fiber increases stool bulk. Peas are an excellent source of dietary fiber.
Page Ref: 349
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 5.C. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with bowel incontinence, constipation, or impaction.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

6) The nurse instructs a client with diarrhea about the medication loperamide. Which client statement indicates the need for further education?

A) "If my diarrhea does not get better within 2 days, I will need to call my healthcare provider for further advice."

B) "I will need to take the medication after each loose stool."

C) "I should continue to take this medication daily until my stools are firm and dry."

D) "If I start to have a fever, I need to contact my healthcare provider about continuing to take this medication."

Answer: C

Explanation: A) The client should call the healthcare provider if the diarrhea does not subside in 2 days.

B) The medication should be taken as prescribed.

C) Continuing to take the medication daily until the stools are firm and dry could result in constipation. If constipation occurs, the client will have another issue for resolution.

D) The client should contact the healthcare provider if a fever develops.

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 5.C. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with bowel incontinence, constipation, or impaction.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

7) The nurse provides education and supportive assistance for the family of a preschool-age client diagnosed with encopresis. Which statement indicates parental understanding of appropriate care? **Select all that apply.**
A) "We will establish a limited schedule of activities that has many breaks to provide opportunities to use the toilet regularly."
B) "We will schedule an appointment with a play therapist to help our older child adjust to our new baby."
C) "We won't change our child's diet because we are afraid it will be stress provoking."
D) "We will work on regular elimination after morning and evening meals."
E) "We will continue to punish our child for having accidents as the behavior is learned and attention seeking."
Answer: A, B, D
Explanation: A) The underlying constipation that leads to encopresis may be caused by the stress of a full schedule of activities or other environmental changes (e.g., birth of a sibling).
B) Psychotherapy involving the child and family may be indicated in instances of dysfunctional parent—child relationships or in cases of suspected sexual abuse.
C) Dietary changes including incorporating high-fiber foods and limiting refined and highly processed foods and dairy products may be helpful.
D) It takes several months for the bowel to be retrained to respond to sphincter stimulation.
E) It is inappropriate to punish the child for having the accidents because they cannot be helped due to the underlying constipation.
Page Ref: 355

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

8) The nurse is caring for a client with chronic constipation. Which findings in the client's health history could be the cause of the current constipation? **Select all that apply.**

A) Bedrest
B) High-fiber diet
C) Low-fiber foods
D) Chronic laxative use
E) Depression

Answer: A, C, D, E

Explanation: A) Factors that contribute to chronic constipation include lack of activity, such as bedrest.
B) A high-fiber diet is a treatment option for chronic constipation.
C) Factors that contribute to chronic constipation include a low fiber diet.
D) Factors that contribute to chronic constipation include chronic laxative use.
E) Factors that contribute to chronic constipation include depression.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

9) A client with constipation is prescribed a bulk-forming laxative. Which consideration should the nurse keep in mind when administering this medication to the client?
A) Offering sufficient water
B) Administering rectally
C) Using to treat acute constipation
D) Assessing for tardive dyskinesia
Answer: A
Explanation: A) It is imperative that bulk-forming laxatives be taken with sufficient water.
B) Bulk-forming laxatives are taken by mouth.
C) Bulk-forming laxatives are not typically for use in the treatment of acute constipation, as results from the medication are not immediate.
D) Bulk-forming laxatives do not cause tardive dyskinesia.

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.C. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with bowel incontinence, constipation, or impaction.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

10) The nurse is reviewing discharge instructions with the mother of a toddler who was hospitalized for constipation. Which statement made by the toddler's mother indicates the need for further education?
A) "I should recognize that when my child walks stiffly on his tiptoes, this could indicate withholding."
B) "Rocking and crossing the legs could be a sign of withholding."
C) "I need to make sure my child eats a low-fiber diet."
D) "Soiling could be a sign of withholding because of involuntary overflow."
Answer: C
Explanation: A) Walking on tiptoes could indicate withholding of stool.
B) Rocking and crossing the legs could indicate withholding of stool.
C) This child requires a diet that is high in fiber.
D) Soiling could be an indication of withholding stool.

Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 5.7. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Differentiate care of patients with bowel incontinence, constipation, and impaction across the lifespan.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

11) The nurse is preparing to teach a class on the prevention of constipation. Which food choice should the nurse include as an example of a high-fiber food?
A) Raw fruits
B) Cooked vegetables
C) White bread
D) Cooked fruits
Answer: A
Explanation: A) Foods high in fiber include raw fruits, bran products, and whole grain products.
B) Low-fiber foods would include cooked vegetables.
C) Low-fiber foods include white bread.
D) Low-fiber foods would include cooked fruits.
Page Ref: 349
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Learning Outcome: 5.C. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with bowel incontinence, constipation, or impaction.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

12) A client seeks medical attention for a "change" in bowel movements. Which clinical manifestation should the nurse expect if the client has a fecal impaction?
A) No passage of stool or fecal material of any kind
B) Passage of soft, formed stools
C) Passage of lumpy stools that are hard and dry
D) Passage of liquid, foul-smelling fecal material in the absence of formed stool
Answer: D
Explanation: A) Passing no stool or fecal material is indicative of an obstruction.
B) Soft, formed stools are generally considered normal.
C) Lumpy stools that are hard and dry are indicative of constipation.
D) Clients with a fecal impaction pass liquid, foul-smelling fecal material in the absence of formed stool; this is the liquid portion of the feces that seeps around the impacted mass.
Page Ref: 347
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.C. Analyze bowel incontinence, constipation, and impaction as they relate to elimination. Identify the clinical manifestations of bowel incontinence, constipation, and impaction.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

13) A client with acute constipation is prescribed a diagnostic barium enema. For which health problem is this diagnostic test indicated?
A) Rectal muscle contractions
B) Completeness of bowel elimination
C) Efficiency with which the food moves through the gastrointestinal tract
D) Structure of the bowel or the presence of tumors or diverticula
Answer: D
Explanation: A) A defecography is used to assess rectal muscle contractions.
B) An anorectal manometry is used to assess the completeness of bowel elimination.
C) A colorectal transit study is used to determine how efficiently food moves through the gastrointestinal tract.
D) A barium enema is used to identify bowel structure, tumors, or diverticula.
Page Ref: 349

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with bowel incontinence, constipation, and impaction.

Exemplar 5.D Urinary Calculi

1) A client reports severe flank pain that radiates from the lower back to the lower abdomen causing spasms, nausea, vomiting, and oliguria. Which action should the nurse take?
A) Complete the physical assessment
B) Notify the health care provider
C) Instruct the client to increase fluids
D) Obtain a urine specimen for culture
Answer: B
Explanation: A) The physical assessment can be completed later.
B) Hydroureter is a complication that occurs when a renal calculus moves into the ureter and blocks and dilates the ureter. Symptoms include severe pain and spasms, nausea, vomiting, and diminished volume of urine. Hydroureter is a medical emergency that can lead to shock, infection, and subsequent impaired renal function; medical collaboration should be initiated immediately.
C) Increasing fluids will not be helpful.
D) The client has oliguria, and a urine specimen might not be possible.
Page Ref: 362
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.1 Demonstrate an understanding of the discipline of nursing's distinct perspective and where shared perspectives exist with other disciplines. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Identify the clinical manifestations of urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

2) The nurse is reviewing information provided during hand-off communication. Which client should the nurse identify as being at risk for developing urinary stones?
A) A 35-year-old woman with quadriplegia from an auto accident
B) A 65-year-old man with a recent history of myocardial infarction
C) A 50-year-old man with type 2 diabetes mellitus
D) A 25-year-old woman with several episodes of urinary infection
Answer: A
Explanation: A) The 35-year-old woman with quadriplegia from an auto accident experiences prolonged immobility, which will increase calcium loss from bones and therefore increase the chance of calcium stones precipitating in the urinary system.
B) A 65-year-old man with a recent history of myocardial infarction does not have a great risk.
C) A 50-year-old man with type 2 diabetes mellitus is not at risk.
D) A 25-year-old woman with several episodes of urinary infection is not at risk.
Page Ref: 360
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Compare the risk factors and prevention of urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

3) The nurse is preparing a presentation about renal conditions for a community fair. Which information should the nurse include regarding renal stones?

A) Older adult clients are particularly at risk for urolithiasis.
B) Men have a greater risk than women.
C) Women have a greater risk overall than men.
D) Frequency of stones is greater in the northern United States.

Answer: B

Explanation: A) Older adults are not at risk for urolithiasis.
B) Males are at greater risk for kidney stones than females.
C) Women have a lesser risk than men for renal stones.
D) In the United States, the incidence varies by region, with the highest frequency in the South.

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Compare the risk factors and prevention of urinary calculi.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

4) A client is admitted to the emergency department and diagnosed with renal colic after experiencing symptoms for 1 week, including those associated with the body's sympathetic response to severe pain. Which problem should the nurse use to plan care for this client?
A) Risk for infection
B) Anxiety
C) Imbalanced nutrition
D) Lack of knowledge
Answer: C
Explanation: A) Risk for infection is not appropriate because the symptoms of urinary calculi do not lead to these diagnoses.
B) Anxiety is not appropriate because the symptoms of urinary calculi do not lead to these diagnoses.
C) The client with renal colic of lengthy duration is at risk for imbalanced nutrition from the resulting nausea.
D) Lack of knowledge is not appropriate because the symptoms of urinary calculi do not lead to these diagnoses.
Page Ref: 370
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Identify the clinical manifestations of urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

5) A client is diagnosed with calcium phosphate kidney stones. Which foods should the nurse teach the client to avoid?
A) Chicken, beef, and ham products
B) Organ meats, sardines, and seafood
C) Tomatoes, fruits, and potatoes
D) Spinach, nuts, wheat
Answer: D
Explanation: A) Chicken, beef, and ham are not high in calcium and do not need to be restricted for this client.
B) Organ meats, sardines, and seafood are not high in calcium and do not need to be restricted for this client.
C) Tomatoes, fruits, and potatoes are not high in calcium and do not need to be restricted for this client.
D) Calcium stones can be prevented by reducing sodium and animal protein intake, getting enough calcium from food, and avoiding foods high in oxalate (e.g., spinach, nuts, wheat bran).
Page Ref: 360
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

6) A client with urinary calculi is admitted to the hospital. When planning care for this client, which goal is most appropriate?
A) The client will lose 25 pounds in 3 months.
B) The client will ambulate three times a day.
C) The client will request pain medication at the onset of pain.
D) The client will shower independently.
Answer: C
Explanation: A) Weight loss is not necessarily a goal with this disease process.
B) The client with urinary calculi is able to ambulate independently.
C) Intense pain is the hallmark of urinary calculi, or kidney stones, that are passing through the urinary system. The client should request pain medication at the onset of pain in order to provide faster relief.
D) The client with urinary calculi is able to shower independently.

Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Apply the nursing process in providing culturally competent care to an individual with urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

WW. TBSM. WS

7) The nurse is providing care to a client whose medication therapy for the treatment of renal calculi has failed. Based on this data, which treatment option does the nurse anticipate for this client?
A) Lithotripsy
B) Surgical removal
C) Dietary control
D) Initiation of IV fluids
Answer: A
Explanation: A) When medication fails to dissolve stones, the preferred method of treatment is lithotripsy, which is using sound waves to crush the stones so they can be passed out of the urinary system.
B) Depending on the location of the stones, surgery may be the next step in the treatment process.
C) Diet is used to prevent further stone formation.
D) Fluids are used to prevent further stone formation.
Page Ref: 363
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.1 Demonstrate an understanding of the discipline of nursing's distinct perspective and where shared perspectives exist with other disciplines. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

8) The nurse is preparing to discharge a client who underwent lithotripsy for the treatment of a struvite kidney stone. Which information should the nurse teach the client to prevent further complications of urinary calculi after discharge?
A) "You will need to increase your oral fluid intake to 1 L/day."
B) "It will be important that you not drive while taking pain medications."
C) "It will be important to maintain a diet high in purines."
D) "You will need to monitor for the signs and symptoms of a urinary tract infection (UTI)."
Answer: D
Explanation: A) Fluid intake per day should be 2.5-3.0 L.
B) By discharge, the stones should have passed and there would be no need for pain medication.
C) Foods high in purines, such as organ meats, are to be avoided.
D) The client with struvite stones may develop a UTI when formed stones obstruct urinary flow. These symptoms should be reported as early as possible to the primary care provider.
Page Ref: 360
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Apply the nursing process in providing culturally competent care to an individual with urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

9) A client is complaining of dull flank pain. List the order of the steps the nurse should take in conducting the physical assessment for this client.
1. Instruct the client.
2. Assess the general appearance.
3. Position the client.
4. Inspect the abdomen for color, contour, symmetry, and distention.
Answer: 1, 3, 2, 4
Explanation: A quick survey of the client enables the nurse to identify any immediate problem as well as the client's ability to participate in the assessment. Begin the examination with the client in a supine position with the abdomen exposed from the nipple line to the pubis. Assess general appearance and inspect the client's skin for color, hydration status, scales, masses, indentations, or scars.
Page Ref: 365
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Apply the nursing process in providing culturally competent care to an individual with urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

10) The nurse is providing care for a client with renal calculi. Which expected outcomes will the nurse include in this client's plan of care? **Select all that apply.**
A) The client rates pain at a 3 on a scale of 0-10 and states that a 3 is acceptable.
B) The client is able to comfortably perform activities of daily living (ADLs).
C) The client demonstrates a fluid intake of 800-1000mL/day.
D) The client remains free of signs and symptoms of infection.
E) The client chooses the appropriate diet to prevent the recurrence of renal calculi.
Answer: A, B, D, E
Explanation: A) Client outcomes should include the client's rating pain at 3 or less on a 0-10 scale.
B) Client outcomes should include being comfortable enough to perform own ADLs.
C) The client's fluid intake should be 2-3 liters a day.
D) The client should be free of signs and symptoms of infection.
E) The client should be instructed on the appropriate diet to prevent the recurrence of renal calculi.
Page Ref: 370
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Apply the nursing process in providing culturally competent care to an individual with urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

11) A client with gout has also been diagnosed with uric acid renal calculi. When planning meals for this client, which diet will the nurse anticipate?
A) Low-purine diet
B) Low-sodium diet
C) A diet high in calcium
D) A diet low in calcium
Answer: A
Explanation: A) A low-purine diet is appropriate in the management of a client with uric acid renal calculi.
B) A low-sodium diet is useful in the management of a client with cystine renal calculi.
C) A diet limiting foods high in calcium is useful when managing a client with calcium phosphate renal calculi.
D) A diet limiting foods high in calcium is useful when managing a client with calcium phosphate renal calculi.
Page Ref: 360
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

12) A client with inflammatory bowel disease has also been diagnosed with calcium phosphate renal calculi. When planning care for this client, which type of medication does the nurse anticipate based on the data?
A) Antibiotic
B) Allopurinol
C) Nonsteroidal anti-inflammatory drug (NSAID)
D) Thiazide diuretic
Answer: D
Explanation: A) Antibiotics are used to help prevent struvite stones.
B) Allopurinol is often prescribed to prevent stones that tend to form in acidic urine (uric acid).
C) Nonsteroidal anti-inflammatory drugs (NSAIDs) are used to treat pain and discomfort and may reduce the amount of narcotic analgesia required for acute renal colic.
D) A thiazide diuretic is used to prevent the formation of calcium stones.
Page Ref: 360
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 1.1 Demonstrate an understanding of the discipline of nursing's distinct perspective and where shared perspectives exist with other disciplines. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with urinary calculi.

MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

13) The nurse is assessing an older adult client whose primary symptoms include fatigue, pruritus, and pain in the right flank area. Which technique should the nurse avoid during the assessment?
A) Palpation over the costovertebral angles and flanks
B) Blunt percussion over the costovertebral angles and flanks
C) Palpation of the lower pole of both kidneys
D) Capturing of both kidneys
Answer: B
Explanation: A) Palpation of the costovertebral angles and flanks can be used to reveal any pain or tenderness.
B) Blunt percussion in a frail older individual is contraindicated.
C) Palpating the lower pole of both kidneys would be appropriate.
D) Capturing both kidneys would be appropriate.
Page Ref: 364
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Differentiate care of patients with renal calculi across the lifespan.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

14) The urinalysis of a client with frequency, urgency, and dysuria reveals nucleation. Which statement should the nurse understand about the composition of the client's urine?
A) It has a high concentration of citrate and glycoproteins.
B) It has a pH of 7.0.
C) It contains trace amounts of blood.
D) It has a high concentration of insoluble salt.
Answer: D
Explanation: A) Citrate and glycoproteins are protective substances in the urine that prevent crystals from forming and would be low in urine containing crystals.
B) A pH of 7.0 is neutral, and urine crystals tends to be either acid or alkaline.
C) While trace amounts of blood may be in the urine, blood is not a finding consistent with crystal formation.
D) High insoluble salt concentration in the urine–known as supersaturation–leads to formation of crystals in the urine.
Page Ref: 359
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Describe the pathophysiology of urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

15) The nurse is asked to explain the difference between calcium phosphate stones from uric acid and cystine stones. Which statement should the nurse make?
A) Calcium phosphate stones are associated with alkaline urine, while uric acid and cystine stones are associated with acid urine.
B) Calcium phosphate stones are associated with acid urine, while uric acid and cystine stones are associated with alkaline urine.
C) Calcium phosphate stones are associated with alkaline urine, while uric acid and cystine stones are associated with neutral urine.
D) Calcium phosphate stones are associated with neutral urine, while uric acid and cystine stones are associated with acid urine.
Answer: A
Explanation: A) Calcium phosphate stones are associated with alkaline urine, while uric acid and cystine stones are associated with acid urine.
B) Calcium phosphate stones are associated with alkaline urine, while uric acid and cystine stones are associated with acid urine.
C) None of the types of stones discussed are associated with urine that has a neutral pH.
D) Calcium phosphate stones are associated with alkaline urine, while uric acid and cystine stones are associated with acid urine.
Page Ref: 360
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Describe the pathophysiology of urinary calculi.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

16) The nurse is caring for clients with renal calculi. Of these clients, which one should the nurse identify as having the *highest* likelihood of requiring surgery to remove the calculi?
A) A 7-year-old with calcium phosphate stones of the bladder
B) A 78-year-old client with struvite stones of the kidney
C) A 31-year-old expectant mother with calcium oxalate stones of the kidney
D) A 46-year-old with uric acid stones of the bladder
Answer: B
Explanation: A) A 7-year-old client would not need surgery but may need other nonsurgical interventions.
B) Older individuals are less likely to pass a stone spontaneously and are more likely to require surgical intervention for stones. Additionally, struvite stones are more often treated with surgical intervention than other types of stones.
C) Surgery is contraindicated in pregnant clients.
D) The client with uric acid stones may require interventions but not surgery.

Learning Outcome: 5.D. Analyze urinary calculi as they relate to elimination. Differentiate care of patients with urinary calculi across the lifespan.
MNL LO: Demonstrate understanding of the concept of elimination in the care of a patient with urinary calculi.

***Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e* (Pearson)**

Module 6 Fluids and Electrolytes

The Concept of Fluids and Electrolytes

1) A client with a fluid volume deficit is experiencing tachycardia, decreased urine output, and pale, cool skin. Which cause should the nurse anticipate as the reason for the client's symptoms?
A) Natural compensatory mechanisms
B) Cardiac failure
C) Pharmacological effects of a diuretic
D) Rapidly infused intravenous fluids
Answer: A
Explanation: A) Compensatory mechanisms to conserve water and sodium and maintain circulation account for many of the manifestations of FVD.
B) The manifestations reported are not indicative of cardiac failure in this client.
C) A diuretic would cause further fluid loss and is contraindicated.
D) Rapidly infused intravenous fluids would not cause a decrease in urine output.
Page Ref: 401
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.2. Differentiate alterations in fluids and electrolytes.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

2) A client's serum calcium level is increasing a few days after surgery. Which intervention should the nurse implement to decrease the client's possibility of developing hypercalcemia?
A) Measure the client's vital signs every 8 hours.
B) Assist the client in ambulating around the room at least three times daily.
C) Irrigate the client's indwelling urinary catheter daily.
D) Help the client turn, cough, and deep breathe every 2 hours.
Answer: B
Explanation: A) Measuring vital signs will not prevent the development of hypercalcemia.
B) Hypercalcemia can occur from immobility. Ambulation helps prevent leaching of calcium from the bones into the serum.
C) Irrigating the indwelling urinary catheter will not prevent the development of hypercalcemia.
D) Deep breathing and coughing will not prevent the development of hypercalcemia.
Page Ref: 384
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 6.4. Explain the promotion of maintaining fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

3) A client has a phosphate level of 2.0 mg/dL. Which action should the nurse take?
A) Enforce contact precautions.
B) Encourage consumption of a high-calorie carbohydrate diet.
C) Strain all urine.
D) Encourage consumption of milk and yogurt.
Answer: D
Explanation: A) There is no need to place this client on contact precautions.
B) There is no need to increase the client's carbohydrate calorie intake.
C) There is no need to strain all urine.
D) A phosphorus level of 2.0 is low, so the client will need additional dietary phosphorus. Providing phosphorus-rich foods such as milk and yogurt is a good way to provide that additional phosphorus.
Page Ref: 384
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 6.4. Explain the promotion of maintaining fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

4) A mother reports that a 3-month-old infant has been vomiting and experiencing diarrhea for several days. Which response should the nurse make?
A) "You should bring the infant in to be seen by the doctor."
B) "Give your baby at least 2 ounces of juice every 2 hours."
C) "Give your baby 50 mL of glucose water every hour."
D) "Measure your baby's urine output for 24 hours and call back tomorrow."
Answer: A
Explanation: A) Parents and caregivers need to be taught the seriousness of vomiting or diarrhea in infants due to rapid fluid loss that can occur in this age group. They should also be taught the importance of bringing an infant in this situation to healthcare providers for evaluation.
B) Encouraging fluids for an infant who is actively vomiting will not improve fluid balance status, and juice is not the best choice of fluid.
C) Encouraging fluids for an infant who is actively vomiting will not improve fluid balance status, and glucose water is not the best choice of fluid.
D) Simply monitoring the loss over the next 24 hours would increase the potential for the infant to become dehydrated.
Page Ref: 394
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 6.8. Differentiate considerations related to the care of patients with alterations in fluid and electrolyte balance throughout the lifespan.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

5) A client taking furosemide (Lasix) has a serum potassium, of 3.4 mEq/L. Which food should the nurse encourage the client to consume?
A) Baked fish
B) Iced tea
C) Banana
D) White bread
Answer: C
Explanation: A) Baked fish is not a high-potassium food.
B) Iced tea is not a high-potassium food.
C) A potassium level of 3.4 mEq/L is low, so the client should be encouraged to consume potassium-rich foods. Of the foods listed, banana is the highest in potassium.
D) White bread is not a high-potassium food.
Page Ref: 384
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 6.4. Explain the promotion of maintaining fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

6) The nurse is reviewing laboratory data for a group of clients. Which total serum calcium levels would the nurse consider normal in an adult client?
A) 9.88 mg/dL
B) 2.21 mg/dL
C) 4.87 mg/dL
D) 7.03 mg/dL
Answer: A
Explanation: A) Normal total serum calcium levels, which represent both bound and unbound calcium, range from 9 to 11 mg/dL.
B) This is a severely low calcium level.
C) This is a severely low calcium level.
D) This is a low calcium level.
Page Ref: 384
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.5. Differentiate among common assessment procedures and tests used to examine fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

7) A client who weighs 154 lbs. is receiving intravenous fluid replacement therapy. Which urinary output would indicate that efforts to rehydrate this client have been successful?
A) 40 mL per hour
B) 20 mL per hour
C) 25 mL per hour
D) 30 mL per hour
Answer: A
Explanation: A) Normal urine output for an adult client is at least 0.5 mL/kg per hour. This client weighs 70 kg, so adequate urine output would be at least 35 mL per hour. Thus, the only option that indicates adequate urine output is 40 mL per hour.
B) Normal urine output for an adult client is at least 0.5 mL/kg per hour. This client weighs 70 kg, so adequate urine output would be at least 35 mL per hour. A urine output of 20 mL/hour indicates that rehydration efforts have not been successful.
C) Normal urine output for an adult client is at least 0.5 mL/kg per hour. This client weighs 70 kg, so adequate urine output would be at least 35 mL per hour. A urine output of 25 mL/hour indicates that rehydration efforts have not been successful.
D) Normal urine output for an adult client is at least 0.5 mL/kg per hour. This client weighs 70 kg, so adequate urine output would be at least 35 mL per hour. A urine output of 30 mL/hour indicates that rehydration efforts have not been successful.

Learning Outcome: 6.5. Differentiate among common assessment procedures and tests used to examine fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

WwW.TeSt.Ws

8) An older adult client has intermittent confusion after a fall. Which condition is the client most at risk for developing?
A) Kidney damage
B) Dehydration
C) Stroke
D) Bleeding
Answer: B
Explanation: A) The risk for kidney damage is not specifically related to aging or fluid and electrolyte issues.
B) As an adult ages, the thirst mechanism declines. Also, an altered level of consciousness can increase the risk of dehydration and high serum osmolality.
C) The risk for stroke is not specifically related to aging or fluid and electrolyte issues.
D) The risk for bleeding is not specifically related to aging or fluid and electrolyte issues.
Page Ref: 396
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 6.8. Differentiate considerations related to the care of clients with alterations in fluid and electrolyte balance throughout the lifespan.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

9) An older adult client receiving intravenous fluids at 150 mL/hr has crackles, shortness of breath, and jugular vein distention. For which complication of IV fluid therapy should the nurse plan care?
A) Speed shock
B) Fluid volume excess
C) Pulmonary embolism
D) An allergic reaction
Answer: B
Explanation: A) The manifestations do not support speed shock.
B) Fluid volume excess may occur if clients, especially the very young or old, receive IV fluid rapidly.
C) The manifestations do not support a pulmonary embolism.
D) The manifestations do not support an allergic reaction.
Page Ref: 396
Cognitive Level: Applying

Learning Outcome: 6.8. Differentiate considerations related to the care of patients with alterations in fluid and electrolyte balance throughout the lifespan.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

10) A client is exhibiting clinical manifestations of a severe fluid and electrolyte imbalance. Which prescriptions should the nurse anticipate from the healthcare provider? **Select all that apply.**
A) Initiate intravenous therapy
B) Initiate hypodermoclysis
C) Administer antibiotics
D) Administer diuretics
E) Administer red blood cells
Answer: A, B, D
Explanation: A) If the client is experiencing a fluid volume deficit, intravenous fluids may be ordered if replacement oral fluids cannot be taken in sufficient quantity.
B) Hypodermoclysis, or subcutaneous administration of fluid, may also be employed as a delivery method, especially among older adults.
C) Antibiotics are not used for fluid and electrolyte imbalance.
D) If the client is experiencing a fluid volume excess, diuretics may be ordered.
E) Blood transfusion is implemented for blood loss, not for a fluid and electrolyte imbalance.
Page Ref: 393
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 6.7. Summarize collaborative therapies used by interdisciplinary teams for patients with alterations in fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

11) The nurse is preparing to administer 20 mEq of potassium chloride to a client who has been vomiting. Which information about the purpose of this medication should the nurse explain to the client?
A) It is vital in regulating muscle contraction and relaxation.
B) It is needed to maintain skeletal, cardiac, and neuromuscular activity.
C) It controls and regulates water balance in the body.
D) It is used to synthesize protein and DNA within the body's cells.
Answer: B
Explanation: A) Calcium is vital in regulating muscle contraction and relaxation.
B) Potassium is the major cation in intracellular fluids, with only a small amount found in plasma and interstitial fluid. Potassium is a vital electrolyte for skeletal, cardiac, and smooth muscle activity.
C) Sodium controls and regulates water balance in the body.
D) Magnesium is used in the cells to synthesize protein and DNA.
Page Ref: 383
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 6.1. Analyze the physiology of fluids and electrolytes in the body.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

12) The nurse is concerned that a client diagnosed with a fluid imbalance is at risk for an alteration in perfusion. Which assessment data should indicate to the nurse that the client has adequate perfusion? **Select all that apply.**

A) Skin turgor 20 seconds
B) Peripheral pulses present and full
C) Capillary refill of nail beds 3 seconds
D) Oriented to person, place, and time
E) Bowel sounds sluggish in all four quadrants

Answer: B, C, D

Explanation: A) Skin turgor would be used to determine whether the fluid imbalance is affecting the client's elimination status. Skin turgor that takes 20 seconds to return to normal indicates that the fluid imbalance is affecting the client's elimination status.
B) Full and present peripheral pulses indicates the client's perfusion status is being maintained.
C) Capillary refill of 3 seconds or less indicates that the client's perfusion status is being maintained.
D) Orientation to person, place, and time indicates that the client's perfusion status is being maintained.
E) Sluggish bowel sounds indicates that the fluid imbalance is affecting the client's elimination status.

Learning Outcome: 6.3. Outline the relationship between fluids and electrolytes and other concepts.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

WwW.TeSt.Ws

13) An adult client's serum sodium level is 150 mg/dL. Which interventions should the nurse plan for this client? **Select all that apply.**

A) Monitor heart rate and rhythm
B) Elevate the head of the bed
C) Instruct on a low-sodium diet
D) Administer diuretics as prescribed
E) Administer potassium supplement as prescribed

Answer: C, D

Explanation: A) Monitoring of heart rate and rhythm would be more appropriate if the client had a potassium imbalance.

B) Elevating the head of the bed would be appropriate if the client were demonstrating signs of fluid volume overload. The client's fluid volume status is not known at this time and raising the head of the bed would not be a routine intervention for a client with an elevated sodium level.

C) For an elevated sodium level, intake of this electrolyte will need to be restricted by adherence to a low-sodium diet.

D) Diuretics may also be prescribed, as certain diuretics block sodium absorption. Diuretics will also remove any excess fluid being held in the body because of the extra sodium.

E) A potassium imbalance is not associated with a sodium imbalance, so more information would be needed before a potassium supplement was prescribed.

Page Ref: 383

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 6.7. Summarize collaborative therapies used by interprofessional teams for patients with alterations in fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

14) During an assessment, the nurse becomes concerned that an older adult client is at risk for dehydration. Which assessment finding would cause the nurse to come to this conclusion?
A) The client has poor skin turgor.
B) The client reports ingesting two glasses of water each day.
C) The client's blood pressure is 140/98 mmHg.
D) The client's body mass index is 20.5.
Answer: B
Explanation: A) Skin turgor is a poor indicator of fluid balance in older adult clients, as the skin's elasticity naturally decreases with age.
B) Poor intake of water (in this case, only 2 glasses per day) could indicate a loss of the thirst response, which is a normal age-related change that increases the risk for dehydration.
C) The client's blood pressure is elevated, but this could indicate either fluid volume overload or sodium sensitivity.
D) The client's body mass index is within normal limits and thus would not contribute to dehydration. Note, however, that a body mass index associated with overweight or obesity could be associated with dehydration, as fat cells contain little or no water.
Page Ref: 390-391
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 6.8. Differentiate considerations related to the care of patients with alterations in fluid and electrolyte balance throughout the lifespan.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

15) The nurse is reviewing laboratory values for a female client suspected of having a fluid imbalance. Which laboratory value should indicate to the nurse that the client is experiencing dehydration?
A) Serum osmolality 230 mOsm/kg
B) Hematocrit 30%
C) Hematocrit 53%
D) Serum potassium 3.8 mEq/L
Answer: C
Explanation: A) Serum osmolality is a measure of the solute concentration of the blood and is used to evaluate fluid balance. Normal values are 280-300 mOsm/kg. An increase in serum osmolality indicates a fluid volume deficit, whereas a decrease reflects fluid volume excess.
B) The hematocrit measures the volume of whole blood that is composed of RBCs. Because the hematocrit is a measure of the volume of cells in relation to plasma, it is affected by changes in plasma volume. A client's hematocrit increases with dehydration and decreases with overhydration. A normal hematocrit value for a female is 37% to 47%.
C) The hematocrit measures the volume of whole blood that is composed of RBCs. Because the hematocrit is a measure of the volume of cells in relation to plasma, it is affected by changes in plasma volume. A client's hematocrit increases with dehydration and decreases with overhydration. A normal hematocrit value for a female is 37% to 47%.
D) Serum potassium is not an electrolyte used to determine alterations in fluid balance. Serum sodium values would be more appropriate for that purpose.
Page Ref: 386
Cognitive Level: Analyzing

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.5. Differentiate among common assessment procedures and tests used to examine fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

16) A client weighing 176 lbs. being treated for dehydration had a 24-hour intake of 2000 mL and urine output of 1200 mL. Which conclusion should the nurse make?
A) Treatment needs to include a diuretic.
B) Treatment has not been effective.
C) Treatment is effective and should continue.
D) Treatment has been effective and should end.
Answer: C
Explanation: A) A diuretic is not needed because the client is being treated for dehydration.
B) Treatment has been effective; however, it should continue until the intake and output are more balanced.
C) Urinary output is normally equivalent to the amount of fluids ingested; the usual range is 1500-2000 mL in 24 hours, or 40-80 mL in 1 hour (0.5 mL/kg per hour). Clients whose intake substantially exceeds output are at risk for fluid volume excess; however, this client is dehydrated, so the extra fluid intake is being used to improve body fluid balance. The client's output is 50 mL/hr, which is within the normal range.
D) Ending treatment now could further jeopardize this client's fluid balance.
Page Ref: 390
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 6.2. Differentiate alterations in fluids and electrolytes.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

17) A client seeks medical attention for a headache and nausea that developed after working in a factory without air conditioning during a high temperature day. The client reports drinking water several times throughout the day because of heavy sweating. Based on this data, which instruction is most appropriate for the nurse to give the client?
A) "Eat something sweet when drinking water."
B) "Eat something salty when drinking water."
C) "Double the amount of water you are drinking."
D) "Drink juices and carbonated sodas instead of water."
Answer: B
Explanation: A) Eating something sweet will not help replace sodium.
B) Both salt and water are lost through sweating. When only water is replaced, the individual is at risk for salt depletion. Symptoms include fatigue, weakness, headache, and gastrointestinal symptoms such as loss of appetite and nausea. Thus, the client should be instructed to eat something salty when drinking water to help replace the lost sodium.
C) Doubling the amount of water being ingested could lead to hyponatremia and further manifestations.
D) Consuming juices and carbonated sodas will not help replace the sodium.
Page Ref: 389
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 6.4. Explain the promotion of maintaining fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

18) The nurse is reviewing the different electrolytes. Which electrolyte would be classified as a cation?
A) Chloride
B) Bicarbonate
C) Phosphate
D) Potassium
Answer: D
Explanation: A) Negatively charged electrolytes are called anions and include chloride.
B) Negatively charged electrolytes are called anions and include bicarbonate.
C) Negatively charged electrolytes are called anions and include phosphate.
D) Positively charged electrolytes are called cations and include potassium.
Page Ref: 378
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.1. Analyze the physiology of fluids and electrolytes in the body.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

19) The nurse is reviewing the pathophysiology of dehydration. Which statement will the nurse identify for a hypertonic state?
A) A dehydrated client would be considered to be in a hypotonic state because the client would have a lower concentration of solutes in the body in relation to water.
B) A dehydrated client would be considered to be in a hypertonic state because the client would have a lower concentration of solutes in the body in relation to water.
C) A dehydrated client would be considered to be in a hypotonic state because the client would have a higher concentration of solutes in the body in relation to water.
D) A dehydrated client would be considered to be in a hypertonic state because the client would have a higher concentration of solutes in the body in relation to water.
Answer: D
Explanation: A) Dehydration causes a hypertonic state.
B) Dehydration causes a hypertonic state; however, there is higher concentration of solutes in relation to water.
C) Dehydration causes a hypertonic state.
D) Dehydrated clients are hypertonic because there is a reduced percentage of water in their bodies and thus a higher concentration of solutes to water.
Page Ref: 379
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.1. Analyze the physiology of fluids and electrolytes in the body.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

20) The nurse is analyzing laboratory values for a client. Which laboratory value indicates hypokalemia?
A) Serum potassium of 3.25 mEq/L
B) Serum potassium of 5.45 mEq/L
C) Serum sodium of 125 mEq/L
D) Serum sodium of 155 mEq/L
Answer: A
Explanation: A) Hypokalemia is a deficit in potassium. Normal serum potassium levels range from 3.5 to 5.3 mEq/L, so of the choices listed, only a serum potassium of 3.25 mEq/L would be considered indicative of hypokalemia.
B) A potassium level of 5.45 mEq/L would be categorized as hyperkalemia.
C) A serum sodium level is not used to determine hypokalemia.
D) A serum sodium level is not used to determine hypokalemia.
Page Ref: 392

Learning Outcome: 6.5. Differentiate among common assessment procedures and tests used to examine fluid and electrolyte balance.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

21) The nurse is reviewing the movements of fluids inside the body. Which process should the nurse identify where the fluid and solutes move together across a membrane from an area of higher pressure to one of lower pressure?
A) Osmosis
B) Filtration
C) Active transport
D) Diffusion
Answer: B
Explanation: A) Osmosis is the movement of water across cell membranes, from the less concentrated solution to the more concentrated solution.
B) Filtration is a process whereby fluid and solutes move together across a membrane from one compartment to another. The movement is from an area of higher pressure to one of lower pressure.
C) Active transport is the process by which substances move across cell membranes from a less concentrated solution to a more concentrated one.
D) Diffusion is the continual intermingling of molecules in liquids, gases, or solids brought about by the random movement of the molecules.

Exemplar 6.A Fluid and Electrolyte Imbalance

1) An older adult client experiencing fever, nausea, and vomiting for the past 2 days has a decreased urine specific gravity. For which condition should the nurse plan care for this client?
A) Congestive heart failure
B) Dehydration
C) Fluid overload
D) Normal changes of aging
Answer: B
Explanation: A) Congestive heart failure would present with respiratory difficulty and peripheral edema.
B) Older adult clients are less able to concentrate their urine, and they have a blunted perception of thirst. Both of these characteristics make them susceptible to dehydration. The client's symptoms of nausea and vomiting suggest decreased intake and increased output through vomiting, placing this client at even higher risk for dehydration.
C) Fluid overload would present with respiratory difficulty and peripheral edema.
D) Fever, nausea, and vomiting are not considered normal.

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Differentiate considerations for care of patients with fluid volume deficit and dehydration across the lifespan.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

2) The nurse receives data received during hand-off communication. Which client should the nurse plan to assess first based on an increased risk for dehydration?
A) A 4-year-old child with a broken leg
B) A 15-month-old child with tachypnea
C) A 16-year-old child with migraine headaches
D) A 10-year-old child with cellulitis of the left leg
Answer: B
Explanation: A) The pediatric client with a fracture is at lower risk for dehydration.
B) The pediatric client with the greatest risk for dehydration is the client who is under 2 years of age and experiencing tachypnea, which increases insensible fluid loss.
C) Migraine headaches do not increase the risk for dehydration.
D) Cellulitis does not increase the risk for dehydration.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

3) The nurse is teaching a group of children and their parents about the prevention of heat-related illness during exercise. Which statement by a parent indicates an appropriate understanding of the preventive techniques taught during the session?
A) "It is important for my child to wear dark clothing while exercising in the heat."
B) "Water is the drink of choice to replenish fluids that are lost during exercise."
C) "My child only needs to hydrate at the end of an exercise session."
D) "I will have my child stop every 15 to 20 minutes during physical activity to drink fluids."
Answer: D
Explanation: A) Wearing dark colors can increase sweating.
B) A combination of water and sports drinks is best to replace fluids lost during exercise.
C) Hydration should occur before and during the activity, not just at the end.
D) During activity, stopping for fluids every 15-20 minutes is recommended.

Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Compare the risk factors for and prevention of fluid volume deficit and dehydration.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

4) A client with dehydration has a low serum sodium level. For which problem should the nurse plan care for this client?
A) Isotonic dehydration
B) Hydrostatic pressure
C) Hypotonic dehydration
D) Osmotic pressure
Answer: C
Explanation: A) Isotonic dehydration occurs when fluid loss is not balanced by intake, and the losses of water and sodium are in proportion.
B) Hydrostatic pressure occurs when extracellular fluid volume excess occurs; the increased fluid volume in the vascular compartment congests the veins.
C) Hypotonic dehydration occurs when fluid loss is characterized by a proportionately greater loss of sodium than water, causing serum sodium to fall below normal levels.
D) Osmotic pressure pulls fluid into the capillaries, usually in response to the presence of albumin and other plasma proteins made by the liver.
Page Ref: 398
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Diagnosis
Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Describe the pathophysiology of fluid volume deficit and dehydration.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

5) The nurse is asked why a client receiving intravenous fluids after cardiac surgery is at risk for fluid volume excess. Which response should the nurse make?
A) "Fluid volume excess commonly occurs due to new onset liver failure caused by the surgery."
B) "Fluid volume excess is frequently caused by the administration of intravenous fluids."
C) "Fluid volume excess is common due to increased levels of antidiuretic hormone in response to the stress of surgery."
D) "Fluid volume excess is frequently caused by inactivity."
Answer: C
Explanation: A) Liver failure is not caused by cardiac surgery.
B) A fluid volume excess should not occur with the proper administration of intravenous fluids.
C) Antidiuretic hormone (ADH) and aldosterone levels are commonly increased following the stress response before, during, and immediately after surgery. This increase leads to sodium and water retention. Adding more fluids intravenously can cause a fluid volume excess and place stress on the heart and circulatory system.
D) Fluid volume excess is not a result of inactivity.

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Describe the pathophysiology of fluid volume excess.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

6) The nurse notes that a client with fluid volume excess has severe, generalized edema. Which term will the nurse use to document this finding?
A) Ascites
B) Anasarca
C) Hypervolemia
D) Orthopnea
Answer: B
Explanation: A) Ascites refers to excess fluid in the peritoneal cavity.
B) Anasarca refers to severe, generalized edema, which may occur due to fluid volume excess.
C) Hypervolemia is an excess of intravascular fluid.
D) Orthopnea is difficulty breathing when supine.
Page Ref: 406

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Identify the clinical manifestations of fluid volume excess.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

7) The nurse is caring for a client with heart failure who is diagnosed with acute hypokalemia. Which drug on the client's medication administration record may have contributed to the client's current hypokalemic state?

A) Demerol
B) Cortisol
C) Hydrochlorothiazide
D) Skelaxin
Answer: B
Explanation: A) Narcotics would not cause acute hypokalemia.
B) Excess potassium loss through the kidneys is often caused by such medications as corticosteroids. Cortisol is a type of corticosteroid and can cause hypokalemia.
C) Hydrochlorothiazide would not cause acute hypokalemia.
D) Skelaxin is a muscle relaxant that does not cause acute hypokalemia.

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Describe the etiology of fluid volume excess.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

8) The spouse of a client with a potassium level of 5.9 mEq/L asks why insulin is being used as treatment. Which response should the nurse make?
A) "The insulin will cause extra potassium to move into his cells, which will lower the potassium level in the blood."
B) "Insulin is safer than other medications that can lower potassium levels."
C) "The insulin lowers his blood sugar levels and causes the extra potassium to be excreted."
D) "The insulin will help his kidneys excrete the extra potassium."
Answer: A
Explanation: A) Serum potassium levels may be temporarily lowered by administering glucose and insulin, which cause potassium to leave the extracellular fluid and enter cells.
B) Giving insulin to decrease serum potassium levels is not considered a safer method than other medications that can be used.
C) Serum potassium is lowered by entering the cells; this is not controlled by serum glucose.
D) Insulin does not promote renal excretion of potassium.
Page Ref: 413

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with fluid volume excess.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

9) A client in the emergency department is being admitted with a diagnosis of fluid volume deficit. When preparing to assess this client, on which body system should the nurse focus to determine the cause of the imbalance?

A) Cardiovascular
B) Genitourinary
C) Gastrointestinal
D) Musculoskeletal

Answer: C

Explanation: A) The client may demonstrate cardiovascular system changes because of the fluid volume deficit; however, this body system does not cause the deficit.

B) The client may demonstrate genitourinary system changes because of the fluid volume deficit; however, this body system does not cause the deficit.

C) The most common cause of fluid volume deficit is excessive loss of gastrointestinal fluids, which can result from vomiting, diarrhea, suctioning, intestinal fistulas, or intestinal drainage. Other causes of fluid losses include chronic abuse of laxatives and/or enemas.

D) The client may demonstrate musculoskeletal system changes because of the fluid volume deficit; however, this body system does not cause the deficit.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

10) The school nurse is preparing a class session for high school students on ways to maintain fluid balance during the summer months. Which interventions should the nurse recommend to decrease the risk of fluid imbalance? **Select all that apply.**
A) Drink diet soda.
B) Drink more fluids during hot weather.
C) Drink flat, caffeine-free cola or ginger ale if vomiting.
D) Reduce the intake of coffee and tea.
E) Exercise between the hours of 10 a.m. and 2 p.m.
Answer: B, C, D
Explanation: A) Diet soda often contains caffeine and should thus be avoided.
B) Actions to prevent fluid volume deficit during the summer months include increasing fluid intake.
C) Actions to prevent fluid volume deficit during the summer months include drinking flat cola or ginger ale if vomiting.
D) Actions to prevent fluid volume deficit during the summer months include reducing the intake of caffeinated beverages like coffee and tea.
E) Exercising between the hours of 10 a.m. and 2 p.m. should also be avoided, as this is typically the hottest time of the day.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

W W . T B S M . W S

11) A child who weighs 33 lbs. has dehydration and is prescribed to receive 50 mL/kg of oral fluids for the next 4 hours. Which total amount of fluids in mL should the nurse provide to the client? Calculate to the nearest whole number.

________ mL

Answer: 750

Explanation: For children with mild to moderate dehydration, oral rehydration therapy is the first intervention, given in frequent, small amounts. For the first 2-4 hours of treatment, 50 mL of fluid for each kilogram of weight should be the target intake. The child weighs 33 lbs, so the first step in determining the total amount of fluid required is to convert this weight to kg by dividing 33 lbs. by 2.2, which yields a weight of 15 kg. The next step is to multiply the volume of fluid by the weight in kg: 50 mL × 15 = 750 mL. Thus, the nurse should provide 750 mL of fluid to the child over 4 hours.

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Differentiate considerations for care of patients with fluid volume deficit and dehydration across the lifespan.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

12) The nurse identifies a problem of impaired skin integrity as applicable for a client diagnosed with heart failure. Which assessment finding did the nurse use to identify this problem?

A) Shortness of breath with ambulation
B) Productive cough
C) +3 pitting edema both feet
D) Heart rate 104 and regular

Answer: C

Explanation: A) Inability to tolerate activity would be appropriate for shortness of breath with ambulation.
B) Impaired gas exchange would be the problem for a productive cough.
C) Edema of the feet increases the client's risk for impaired skin integrity.
D) A problem with tissue perfusion would be appropriate for a heart rate of 104 and regular.

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Apply the nursing process in providing culturally competent care to an individual with fluid volume excess.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

13) A client diagnosed with heart failure is prescribed an oral fluid restriction of 1200 mL per day. Which amount of fluid in ounces would the client be permitted during the day shift?

A) 200 mL
B) 300 mL
C) 400 mL
D) 600 mL

Answer: D

Explanation: A) When calculating a fluid restriction, 50% of the total daily fluid allowance should be allocated to the day shift. The amount of 200 mL would be given over the night shift.

B) When calculating a fluid restriction, 50% of the total daily fluid allowance should be allocated to the day shift. The amount of 300 mL would be given during the evening shift.

C) The amount of 400 mL would not be any amount given during the fluid restriction.

D) When calculating a fluid restriction, 50% of the total daily fluid allowance should be allocated to the day shift. The remaining 50% can be either divided equally between the evening and night shifts, or 33% of the remaining volume can be provided on the evening shift with the balance provided during the night shift. Thus, for a fluid restriction of 1200 mL, the client would be permitted 600 mL of fluid during the day shift.

Page Ref: 408

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Apply the nursing process in providing culturally competent care to an individual with fluid volume excess.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

14) The nurse is instructing a client diagnosed with heart failure about a prescribed sodium-restricted diet. Which client statement indicates that additional teaching is required?

A) "I can use as much salt substitute as I want."

B) "I have to read the labels on foods to find out the sodium content."

C) "I have to limit the intake of food with baking soda or baking powder."

D) "I can use spices and lemon juice to add flavor to food when cooking."

Answer: A

Explanation: A) Low-sodium salt substitutes are not really sodium-free; they may contain half as much sodium as regular salt. The client should be instructed to use salt substitutes sparingly because larger amounts often taste bitter instead of salty.

B) Clients should be instructed to read food labels for the amount of sodium in the food item.

C) Baking soda and baking powder contain sodium, so intake should be limited when on a sodium-restricted diet.

D) In place of salt or salt substitutes, the client should be instructed to use herbs, spices, lemon juice, vinegar, and wine as flavoring when cooking.

Page Ref: 409

Cognitive Level: Analyzing

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Apply the nursing process in providing culturally competent care to an individual with fluid volume excess.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

15) The nurse is reviewing electrolyte imbalances. Which mineralocorticoid will the nurse identify that assists in regulating the body's serum sodium balance?

A) Antidiuretic hormone
B) Parathyroid hormone
C) Aldosterone
D) Progesterone

Answer: C

Explanation: A) When extracellular fluid (ECF) osmolality increases, antidiuretic hormone is secreted, leading to additional water reabsorption.

B) Parathyroid hormone helps control calcium level.

C) Aldosterone is the principal mineralocorticoid that assists in regulating serum sodium balance. It does this by stimulating the kidneys to conserve sodium and to excrete potassium when serum sodium levels fall below normal. Water follows the sodium, and blood volume rises.

D) Progesterone is a reproductive hormone.

Page Ref: 412

Cognitive Level: Understanding

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Describe the etiology of fluid volume deficit and dehydration.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

16) The nurse is asked to explain hypercalcemia. Which information will the nurse provide?
A) Hypercalcemia is often a result of hyperparathyroidism, because the increased levels of parathyroid hormone associated with this condition cause an increase in the amount of calcium in the blood.
B) Hypercalcemia is often a result of hyperparathyroidism, because the decreased levels of parathyroid hormone associated with this condition cause an increase in the amount of calcium in the blood.
C) Hypercalcemia is often a result of hypoparathyroidism, because the increased levels of parathyroid hormone associated with this condition cause an increase in the amount of calcium in the blood.
D) Hypercalcemia is often a result of hypoparathyroidism, because the decreased levels of parathyroid hormone associated with this condition cause an increase in the amount of calcium in the blood.
Answer: A
Explanation: A) Calcium levels are controlled in part by parathyroid hormone; when levels of this hormone rise, so do serum calcium levels. Hyperparathyroidism is a condition characterized by an overactive parathyroid gland. Excessive activity of this gland leads to the secretion of abnormally high amounts of parathyroid hormone, which in turn may lead to hypercalcemia.
B) Calcium levels are controlled in part by parathyroid hormone; when levels of this hormone rise, so do serum calcium levels.
C) Hyperparathyroidism is a condition characterized by an overactive parathyroid gland. Excessive activity of this gland leads to the secretion of abnormally high amounts of parathyroid hormone, which in turn may lead to hypercalcemia.
D) Hyperparathyroidism is a condition characterized by an overactive parathyroid gland. Excessive activity of this gland leads to the secretion of abnormally high amounts of parathyroid hormone, which in turn may lead to hypercalcemia.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Describe the pathophysiology of fluid volume deficit and dehydration.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

17) The nurse is reviewing fluid imbalances. Which fluid volume disturbance is caused by an increase in blood hydrostatic pressure?
A) Fluid volume excess, because the pressure would force fluid out through the lymphatic system and into the interstitial compartment.
B) Fluid volume deficit, because the pressure would force fluid out of the interstitial compartment and into the lymphatic system.
C) Fluid volume excess, because the pressure would force fluid out through the capillary walls and into the interstitial compartment.
D) Fluid volume deficit, because the pressure would force fluid out of the interstitial compartment and into the capillaries.
Answer: C
Explanation: A) The excess fluid is not forced out through the lymphatic system.
B) An increase in blood hydrostatic pressure results in fluid volume excess.
C) When extracellular fluid volume excess occurs, the increased fluid volume in the vascular compartment congests the veins. This leads to an increase in blood hydrostatic pressure. In turn, as the pressure against the sides of the capillaries increases, more fluid enters the interstitial compartment, causing further fluid volume excess.
D) An increase in blood hydrostatic pressure results in fluid volume excess.
Page Ref: 405

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.A. Analyze fluid and electrolyte imbalance and their effects on the body. Describe the pathophysiology of fluid volume excess.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with a fluid and electrolyte imbalance.

Exemplar 6.B Acute Kidney Injury

1) A client with acute kidney asks if a kidney transplant is needed. Which response should the nurse make?
A) "No, don't think that. You're going to be fine."
B) "In most cases, your condition can be reversed with prompt treatment and usually will not destroy the kidneys."
C) "Kidney transplantation is highly likely, so it would be a good idea to start talking to your family members about organ donation."
D) "When the doctor comes to see you, we can talk about whether you will need a transplant."
Answer: B
Explanation: A) Telling the client that everything will be fine is condescending, provides no information, and is not within the nurse's ability to know.
B) AKI is often resolved without the need for transplant if treatment is initiated quickly.
C) There is no need to start lining up donors.
D) There is no need to wait for the provider to arrive to explore options.
Page Ref: 421
Cognitive Level: Analyzing
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

2) The nurse reviews a client's medical history and determines that the client is at risk for acute kidney injury (AKI). Which items in the client's history support this conclusion? **Select all that apply.**
A) Dehydration
B) Renal calculi
C) Ineffective wound healing
D) Low serum albumin
E) Hypertension
Answer: A, B, E
Explanation: A) Dehydration can precipitate AKI.
B) Renal calculi can precipitate AKI.
C) Ineffective wound healing does not cause AKI.
D) A low serum albumin does not cause AKI.
E) Hypertension can precipitate AKI.
Page Ref: 419
Cognitive Level: Applying

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Compare the risk factors for and prevention of acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

3) The parents of a young school-age client with an acute kidney injury after a streptococcus infection asks what caused the child to be so ill. Which response should the nurse make?
A) "Your child does not eat enough dietary protein."
B) "Your child has a congenital defect that led to renal failure."
C) "Your child's renal failure has been caused by a low calcium level."
D) "Your child's recent infection may have caused the renal failure."
Answer: D
Explanation: A) A low-protein diet does not cause AKI.
B) The child has no evidence of a congenital defect.
C) A low-calcium diet will not cause AKI.
D) Clients with streptococcus are at risk for kidney and cardiac sequelae.
Page Ref: 4428
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Differentiate considerations for care of patients with acute kidney injury across the lifespan.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

4) The nurse notes that a client with acute kidney injury (AKI) has a problem of excess fluid volume. Which assessment data supports this problem?
A) Pitting edema in the lower extremities
B) Bowel sounds positive in four quadrants
C) Wheezing in the lungs
D) Generalized weakness
Answer: A
Explanation: A) The client in acute kidney injury (AKI) will likely be edematous, because the kidneys are not producing urine.
B) Bowel sounds in four quadrants is a normal assessment finding.
C) Wheezing in the lungs is an assessment consistent with asthma, not AKI.
D) Generalized weakness may be due to whatever disease process precipitated the kidney failure.
Page Ref: 428
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | Nursing Process: Evaluation
Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Identify the clinical manifestations of acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

5) A client diagnosed with acute kidney injury (AKI) is receiving peritoneal dialysis. Which statement should the nurse make when explaining the process to the client and family?
A) "The peritoneum is more permeable because of the presence of excess metabolites."
B) "The metabolites will diffuse from the interstitial space to the bloodstream mainly through diffusion and ultrafiltration."
C) "The peritoneum acts as a semipermeable membrane through which wastes move by diffusion and osmosis."
D) "The solutes in the dialysate will enter the bloodstream through the peritoneum."
Answer: C
Explanation: A) The peritoneum is not more permeable because of excess metabolites.
B) Metabolic waste products and excess water can be eliminated through osmosis and diffusion using the peritoneum as the semipermeable membrane.
C) The peritoneum acts as a semipermeable membrane, allowing substances to move from an area of high concentration (the blood) to an area of lower concentration (the dialysate). Metabolic waste products and excess water can be eliminated through osmosis and diffusion using the peritoneum as the semipermeable membrane.
D) The solutes in the dialysate do not enter the bloodstream.
Page Ref: 426

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

6) The nurse is caring for a client diagnosed with acute kidney injury (AKI). When reviewing the client's laboratory data, which findings should indicate to the nurse that the client has met the expected outcomes? **Select all that apply.**

A) Decreasing serum creatinine
B) Decreasing blood urea nitrogen (BUN)
C) Decreasing neutrophil count
D) Decreasing lymphocyte count
E) Decreasing erythrocyte count

Answer: A, B

Explanation: A) Creatinine is the metabolic end product of creatine phosphate and is excreted via the kidneys in relatively constant amounts.
B) BUN, a measurement of the nitrogen portion of urea, is also excreted in urine and is a good indicator of renal function.
C) Neutrophils are not used to monitor the return of renal function.
D) Lymphocytes are not used to monitor the return of renal function.
E) Erythrocytes are not used to monitor the return of renal function.

Page Ref: 430
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

7) The nurse is caring for a client receiving hemodialysis. For which complication will the nurse assess this client?
A) Hemorrhage
B) Hypotension
C) Localized infection
D) Hypertension
Answer: B
Explanation: A) Bleeding is another possible complication, although it does not occur as often as hypotension.
B) Hypotension is the most frequent complication during hemodialysis. It may result from changes in serum osmolality, rapid removal of fluid from the vascular compartment, vasodilation, and other factors.
C) Infection is also commonly associated with hemodialysis, although it occurs following treatment rather than during dialysis.
D) Hypertension is not a complication of hemodialysis.
Page Ref: 424
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with acute kidney injury.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

8) The nurse provides dietary teaching to a client with acute kidney injury (AKI). Which statement indicates that teaching about proteins with high biological value was effective?

A) "I will be sure to include eggs in my diet."
B) "I should include vegetables at every meal."
C) "Legumes should be included in my diet, because they are complete proteins."
D) "I will eat nuts daily because they are high in protein."

Answer: A

Explanation: A) Eggs are an excellent source of essential amino acids and are recommended as part of the diet for a client with acute kidney injury (AKI) who is on a protein-restricted diet.
B) Vegetables do contain protein, but they are incomplete proteins and thus not as good a protein source as eggs.
C) Legumes contain protein, but they are incomplete proteins and thus not as good a protein source as eggs.
D) Nuts contain protein, but they are incomplete proteins and thus not as good a protein source as eggs.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with acute kidney injury.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

9) The nurse is planning care for a client admitted with a diagnosis of heart failure. Based on this diagnosis, which type of kidney failure is the client at an increased risk for experiencing?
A) Prerenal hypovolemia
B) Intrarenal glomerular injury
C) Intrarenal acute tubular necrosis
D) Prerenal low cardiac output
Answer: D
Explanation: A) Causes of prerenal kidney failure due to hypovolemia include hemorrhage, dehydration, burns, wounds, and excess fluid loss from the gastrointestinal tract.
B) Causes of intrarenal kidney failure due to glomerular injury include glomerulonephritis, disseminated intravascular coagulation, vasculitis, hypertension, toxemia of pregnancy, and hemolytic uremic syndrome.
C) Causes of intrarenal kidney failure due to acute tubular necrosis include ischemia resulting from conditions associated with prerenal failure, toxins, hemolysis, and rhabdomyolysis.
D) Heart failure is one possible cause of prerenal kidney failure due to low cardiac output.
Page Ref: 417

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

10) The nurse is concerned that an older adult client is at risk for developing acute kidney injury (AKI). Which data in the client's history supports the nurse's concern? **Select all that apply.**
A) Diagnosed with hypotension
B) Recent aortic valve replacement surgery
C) Prescribed high doses of intravenous antibiotics
D) Total hip replacement surgery 5 years ago
E) Taking medication for type 2 diabetes mellitus
Answer: A, B, C
Explanation: A) Older adults develop acute kidney injury more frequently because of the higher incidence of hypotension.
B) Older adults develop acute kidney injury more frequently because of the higher incidence of major surgeries.
C) Older adults develop acute kidney injury more frequently because of the higher incidence of treatment with nephrotoxic drugs.
D) A previous history of hip replacement surgery is not a risk factor for the development of acute kidney injury.
E) Current treatment for type 2 diabetes mellitus is not a risk factor for the development of acute kidney injury.
Page Ref: 428

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Compare the risk factors for and prevention of acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

11) A young child is experiencing a sudden onset of nausea, vomiting, and lethargy. For which clinical manifestations will the nurse suspect that the child is experiencing acute kidney injury (AKI)? **Select all that apply.**

A) Elevated blood pressure
B) Postural hypotension
C) Wheezing
D) Edema
E) Hematuria

Answer: A, D, E

Explanation: A) Clinical manifestations of AKI in children includes hypertension.
B) Postural hypotension is a manifestation of acute kidney injury in an older person.
C) Wheezing is not a manifestation of acute kidney injury.
D) Clinical manifestations of AKI in children include edema.
E) Clinical manifestations of AKI in children include gross hematuria.

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Differentiate considerations for care of patients with acute kidney injury across the lifespan.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

12) A client diagnosed with acute kidney injury (AKI) has jugular vein distention, lower extremity edema, and elevated blood pressure. Which problem will the nurse use to guide this client's care?
A) Potential for inadequate renal perfusion
B) Fluid volume excess
C) Potential for decreased cardiac perfusion
D) Potential for infection
Answer: B
Explanation: A) Oliguria or reduced urine output would be a symptom associated with the potential for inadequate renal perfusion.
B) Jugular vein distention, edema, and elevated blood pressure are all indications of excess fluid.
C) Alterations in heart rate and rhythm would be symptoms associated with the potential for decreased cardiac perfusion.
D) The client is not demonstrating any manifestations of an infection.
Page Ref: 428
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Identify the clinical manifestations of acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

13) A client agrees to receive long-term hemodialysis to treat acute kidney injury (AKI). For which surgical procedure should the nurse prepare this client?
A) Insertion of a double-lumen catheter into the subclavian artery
B) Placement of a peritoneal catheter
C) Insertion of a subarachnoid-peritoneal shunt
D) Placement of an arteriovenous fistula
Answer: D
Explanation: A) A double-lumen catheter inserted into a major artery is used as temporary vascular access for continuous renal replacement therapy.
B) A peritoneal catheter is used for peritoneal dialysis, not hemodialysis.
C) A subarachnoid-peritoneal shunt is used to remove excess cerebrospinal fluid and not for hemodialysis.
D) For long-term vascular access needed for hemodialysis, an arteriovenous (AV) fistula is created. The fistula is created by surgical anastomosis of an artery and vein, usually the radial artery and cephalic vein. It takes about a month for the fistula to mature so that it can be used for taking and replacing blood during dialysis.

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

14) A client with acute kidney failure is complaining of a metallic taste in the mouth and has no appetite. Which intervention by the nurse is appropriate?
A) Provide mouth care before meals.
B) Administer an antiemetic as prescribed.
C) Restrict fluids.
D) Encourage the intake of protein, salt, and potassium.
Answer: A
Explanation: A) A metallic taste in the mouth is due to uremia. The nurse should provide mouth care before meals to reduce this taste sensation and improve the client's oral intake.
B) An antiemetic would be prescribed for nausea.
C) Restricting fluids would not reduce the metallic taste in the mouth.
D) Encouraging intake of protein, salt, and potassium would exacerbate the uremia that is causing the metallic taste in the mouth.
Page Ref: 429

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

15) A client is diagnosed with recurrent urinary tract calculi. Which type of acute kidney injury (AKI) is this client at risk for developing?

A) Prerenal AKI

B) Intrinsic AKI

C) Postrenal AKI

D) Intrarenal AKI

Answer: C

Explanation: A) Prerenal AKI results from conditions that affect renal blood flow and perfusion.

B) Intrinsic AKI (also called intrarenal AKI) is characterized by acute damage to the renal parenchyma and nephrons.

C) Obstructive causes of AKI are classified as postrenal. Any condition that prevents urine excretion–including urinary tract calculi–can lead to postrenal AKI.

D) Intrarenal AKI is characterized by acute damage to the renal parenchyma and nephrons.

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Describe the pathophysiology of acute kidney injury.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

16) The nurse is caring for a client with an acute kidney injury (AKI). Which symptom indicates to the nurse that the client is entering the maintenance phase of the condition?
A) Onset of metabolic acidosis
B) Onset of diuresis
C) Increase in glomerular filtration rate
D) Decrease in serum potassium levels
Answer: A
Explanation: A) The maintenance phase of AKI is characterized by a significant fall in glomerular filtration rate (GFR) and tubular necrosis. Oliguria, azotemia, fluid retention, electrolyte imbalances, and metabolic acidosis may all develop.
B) Onset of diuresis indicates the recovery phase of AKI.
C) Increasing glomerular filtration rate is associated with the recovery phase of AKI.
D) During the maintenance phase, impaired potassium excretion leads to hyperkalemia, or increased serum potassium levels.
Page Ref: 419

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Identify the clinical manifestations of acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

17) The nurse is caring for a client with acute kidney injury (AKI). Which laboratory finding indicates that the condition is a result of glomerular damage?

A) Hyperkalemia

B) Proteinuria

C) Urine specific gravity of 1.010

D) Moderate anemia

Answer: B

Explanation: A) Hyperkalemia is common in AKI regardless of the cause.

B) Proteinuria, or excess protein in the urine, is suggestive of glomerular damage as the cause of a client's AKI.

C) Urine specific gravity of 1.010 is common in AKI regardless of the cause.

D) Moderate anemia is common in AKI regardless of the cause.

Page Ref: 421

Cognitive Level: Understanding

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with acute kidney injury.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

18) The nurse is caring for a client with acute kidney injury (AKI). Which medication will the nurse expect to be prescribed to increase renal blood flow in this client?
A) Furosemide (Lasix)
B) Mannitol (Osmitrol)
C) Bumetanide (Bumex)
D) Dopamine (Intropin)
Answer: D
Explanation: A) In clients with acute kidney injury, dopamine (Intropin) is administered in low doses by intravenous infusion to increase renal blood flow. If restoration of renal blood flow does not improve urinary output, a potent loop diuretic, such as furosemide (Lasix may be given with intravenous fluids.
B) If restoration of renal blood flow does not improve urinary output, an osmotic diuretic, such as mannitol (Osmitrol), may be given with intravenous fluids.
C) If restoration of renal blood flow does not improve urinary output, bumetanide (Bumex) may be given with intravenous fluids.
D) In clients with acute kidney injury, dopamine (Intropin) is administered in low doses by intravenous infusion to increase renal blood flow.
Page Ref: 421
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 6.B. Analyze acute kidney injury as it relates to fluids and electrolytes. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with acute kidney injury.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with acute kidney injury.

Exemplar 6.C Chronic Kidney Disease

1) The spouse of a client with chronic kidney disease (CKD) asks why the client developed anemia. Which response should the nurse make?
A) "Your spouse has a genetic tendency for the development of anemia."
B) "The increased metabolic waste products in your spouse's body depress the bone marrow and cause anemia."
C) "Your spouse's kidneys are producing reduced amounts of the hormone erythropoietin, and this is the cause of the anemia."
D) "Your spouse is not eating enough iron-rich foods, and this has led to anemia."
Answer: C
Explanation: A) There is no evidence that the client has a genetic tendency for anemia.
B) Metabolic wastes do not suppress bone marrow.
C) Anemia is common in clients with chronic kidney disease. Among the factors causing the anemia are decreased production of erythropoietin by the kidneys and shortened red blood cell (RBC) life.
D) Diet does not factor into the production of erythropoietin.
Page Ref: 434
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Identify the clinical manifestations of CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

2) A client with chronic kidney disease (CKD) reports using salt substitutes. For which reason will the nurse instruct the client to avoid this product?
A) They will increase the risk of AV fistula infection.
B) They will cause the client to retain fluid.
C) They will interact with the client's antihypertensive medications.
D) They can contribute to hyperkalemia.
Answer: D
Explanation: A) An AV fistula does need to be protected from injury and infection, but this is unrelated to use of salt substitutes.
B) Increases in weight do need to be reported to the healthcare provider as a possible indication of fluid volume excess, but this is not the reason why salt substitutes should be avoided.
C) Control of hypertension is essential in the management of a client with kidney disease, but salt substitutes are not known to interact with antihypertensive medications.
D) Many salt substitutes contain high levels of potassium chloride. Potassium intake must be carefully regulated in clients with chronic kidney disease and use of salt substitutes can worsen hyperkalemia.
Page Ref: 438
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

3) A client with chronic kidney disease (CKD) reports no bowel movements in the past 2 days. Which treatment should the nurse anticipate being prescribed to prevent hyperkalemia in this client?
A) Folic acid
B) Furosemide
C) Sodium bicarbonate
D) Potassium-ion exchange resin
Answer: D
Explanation: A) Folic acid is used to treat anemia.
B) Furosemide is used to reduce extracellular fluid volume and edema.
C) Sodium bicarbonate is used correct mild acidosis.
D) A potassium-ion exchange resin can be used to reduce the level of potassium in the client with CKD.
Page Ref: 438
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | Nursing Process: Planning
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Differentiate considerations for care of patients with CKD across the lifespan.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

4) The nurse is planning care for a client diagnosed with chronic kidney disease (CKD) and osteoporosis. Which problem should the nurse use to guide this client's care?

A) Anxiety

B) Disturbed body image

C) Potential for injury

D) Potential for bleeding

Answer: C

Explanation: A) Anxiety is not related to osteoporosis.

B) The client on hemodialysis may have a disturbed body image, but in this case, the client is not undergoing hemodialysis.

C) The client with CKD and osteoporosis is at high risk for fractures; therefore, preventing injury should be the priority problem.

D) The client is at risk for anemia, but not bleeding.

Page Ref: 441

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with CKD.

MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

5) A client with chronic kidney disease (CKD) is prescribed calcium acetate. Which information will the nurse provide the client about this medication?
A) "The calcium acetate will lower your serum phosphate levels."
B) "The calcium acetate helps neutralize your gastric acids."
C) "The calcium acetate will help stimulate your appetite."
D) "The calcium acetate will decrease your serum creatinine levels."
Answer: A
Explanation: A) The client with CKD has elevated phosphate levels due to the inability of the damaged kidney to excrete this electrolyte. Calcium acetate, when given with meals, will bind serum phosphorus and therefore lower the serum level.
B) Although calcium acetate can act as an antacid and neutralize gastric acid when given between meals, this is not the reason it is given to a client with CKD.
C) This medication has no effect on appetite stimulation.
D) Calcium acetate has no effect on serum creatinine.
Page Ref: 438
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

6) The nurse is preparing to administer a hemodialysis treatment for a client diagnosed with chronic kidney disease (CKD). Which laboratory values should the nurse anticipate prior to the client's treatment? **Select all that apply.**

A) Increased blood urea nitrogen (BUN)
B) Decreased potassium
C) Decreased phosphorus
D) Increased urine osmolality
E) Increased creatinine

Answer: A, E

Explanation: A) The client will have an increased blood urea nitrogen (BUN) level due to the damaged kidneys.
B) Potassium increases during renal failure due to the inability of the kidney to excrete it.
C) Phosphorus increases during renal failure due to the inability of the kidney to excrete it.
D) The damaged kidney is unable to excrete solutes; therefore, the serum osmolality will be increased and the urine osmolality will be decreased.
E) The damaged kidney is unable to excrete waste products, including creatinine, so creatinine levels will be increased.

Page Ref: 436
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

7) The nurse is evaluating whether the drug sodium polystyrene sulfonate (Kayexalate) is exerting the desired therapeutic effect for a client diagnosed with chronic kidney disease (CKD). Which therapeutic effect should the nurse anticipate from this medication?
A) Increased serum sodium
B) Increased stool excretion
C) Decreased urine specific gravity
D) Decreased serum potassium
Answer: D
Explanation: A) This drug does not affect the serum sodium level.
B) Although the client might have increased stools, the therapeutic effectiveness of the drug is measured by monitoring the serum potassium.
C) This drug does not affect the urine specific gravity.
D) The client with CKD is unable to excrete potassium. Therefore, the drug sodium polystyrene sulfonate (Kayexalate) is used in order to exchange sodium for potassium in the large intestine, resulting in decreased serum potassium levels.
Page Ref: 438
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

8) The nurse is caring for a client with chronic kidney disease (CKD). Which stage of this condition is characterized by hypertension, anemia, malnutrition, altered bone metabolism, metabolic acidosis, and a severely decreased glomerular filtration rate?
A) Stage 1
B) Stage 2
C) Stage 3
D) Stage 4
Answer: D
Explanation: A) Clients in stage 1 of chronic kidney disease (CKD) are asymptomatic and have a normal or increased glomerular filtration rate (GFR).
B) During stage 2, the GFR mildly decreases and hypertension may develop.
C) In stage 3, there is a moderate GFR decrease, as well as hypertension, possible anemia and fatigue, anorexia, possible malnutrition, and bone pain.
D) Stage 4 involves a severely decreased GFR as well as hypertension, anemia, malnutrition, altered bone metabolism, edema, metabolic acidosis, hypercalcemia, possible uremia, and azotemia.
Page Ref: 433
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Describe the pathophysiology of CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

9) A client with a history of hypertension is diagnosed with chronic kidney disease (CKD). When the client asks the nurse how this disease developed, which response should the nurse make?
A) "Thickening of the kidney structures and gradual death of nephrons has led to this diagnosis."
B) "Cysts have compressed your renal tissue and destroyed your kidneys, causing this diagnosis."
C) "High blood pressure has reduced your renal blood flow, harming the kidney tissue and causing this diagnosis."
D) "Immune complexes have formed in your kidney tissue, causing inflammation that has led to this diagnosis."
Answer: C
Explanation: A) Diabetic nephropathy causes chronic kidney disease (CKD) by thickening and sclerosis of the glomerular basement membrane and the glomerulus with a gradual destruction of nephrons.
B) Polycystic kidney disease causes CKD by multiple bilateral cysts gradually compressing renal tissue, impairing renal perfusion and leading to ischemia, which damages and destroys normal kidney tissue.
C) Long-standing hypertension leads to sclerosis and narrowing of renal arterioles and small arteries with subsequent reduction of blood flow. This leads to ischemia, glomerular destruction, and tubular atrophy.
D) Systemic lupus erythematosus causes CKD by the formation of immune complexes in the capillary basement membrane, which lead to inflammation and sclerosis.
Page Ref: 432
Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Describe the pathophysiology of CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

10) The nurse is planning a seminar to instruct community members on ways to reduce the development of chronic kidney disease (CKD). Which topics should the nurse include in the seminar? **Select all that apply.**
A) Avoid eating red meat.
B) Control blood glucose levels in diabetes mellitus.
C) Adhere to medication regimen to control hypertension.
D) Participate in regular exercise.
E) Avoid smoking.
Answer: B, C, D, E
Explanation: A) Red meat does not need to be avoided to prevent the development of CKD.
B) Prevention of CKD should focus on aggressive management of chronic disease states, especially diabetes.
C) Prevention of CKD should focus on aggressive management of chronic disease states, especially hypertension.
D) Prevention of CKD should focus on aggressive management of chronic disease states, especially diabetes and hypertension. In addition, clients should exercise regularly to prevent the development of CKD.
E) Prevention of CKD should include the avoidance of smoking.
Page Ref: 433
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Compare the risk factors for and prevention of CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

11) During a home visit, the nurse is concerned that an older adult client is developing chronic kidney disease (CKD). Which data in the client's assessment caused the nurse to have this concern? **Select all that apply.**
A) Progressive edema
B) Complaints of hip joint pain
C) New onset of hypertension
D) Recent increase in hunger and thirst
E) Warm moist skin
Answer: A, C
Explanation: A) The manifestations of chronic kidney disease (CKD) often are missed in aging clients because edema may be attributed to a preexisting cardiovascular condition.
B) Hip joint pain is not a manifestation of CKD in the older client.
C) New onset of hypertension could indicate the development of CKD in an older client.
D) An increase in hunger and thirst could be an indication of diabetes mellitus and not CKD in the older client.
E) A client with CKD will have pale dry skin with poor turgor.
Page Ref: 441
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Differentiate considerations for care of patients with CKD across the lifespan.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

12) While caring for a client diagnosed with end-stage renal disease (ESRD), the nurse tracks the client's serum albumin level. For which problem is this action most indicated?
A) Fluid volume excess
B) Undernutrition
C) Risk for inadequate renal perfusion
D) Risk for infection
Answer: B
Explanation: A) Assessing for edema would address the problem of fluid volume excess.
B) Interventions appropriate for undernutrition include monitoring laboratory values such as serum albumin.
C) Monitoring for orthostatic blood pressure changes would be appropriate for inadequate renal perfusion.
D) Monitoring the white blood cell count would be an intervention appropriate for the problem of risk for infection.
Page Ref: 442
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

13) The nurse instructs a client diagnosed with chronic kidney disease (CKD) regarding the prescribed medication furosemide (Lasix). Which client statement indicates that the teaching has been effective?

A) "I will take this medication to keep my calcium balance normal."
B) "This medication will make sure I have enough red blood cells in my body."
C) "I will take this pill to keep my protein level in my body stable."
D) "This pill will reduce the swelling in my body and get rid of the extra potassium."

Answer: D

Explanation: A) Oral phosphorus-binding agents, such as calcium carbonate or calcium acetate, are given to lower serum phosphate levels and normalize serum calcium levels.
B) Folic acid and iron supplements are given to combat anemia associated with chronic kidney disease.
C) There is no medication provided to a client with CKD that is used to stabilize protein levels in the body.
D) Furosemide (Lasix) is a loop diuretic that may be prescribed to reduce extracellular fluid volume and edema. Diuretic therapy also can reduce hypertension and cause potassium wasting, lowering serum potassium levels.

Page Ref: 438
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Apply the nursing process in providing culturally competent care to an individual with CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

14) A client with a diagnosis of chronic kidney disease (CKD) is experiencing manifestations of anemia. Which treatment should the nurse anticipate for this client?
A) Begin fluid restriction.
B) Administer intravenous glucose and insulin.
C) Begin a low-sodium diet.
D) Administer epoetin injections.
Answer: D
Explanation: A) Fluid restriction would be indicated for uremia caused by CKD.
B) Intravenous glucose and insulin may be used to reduce excessive potassium that is caused by CKD.
C) A low-sodium diet is used to help reduce fluid volume excess that is caused by CKD.
D) Epoetin injections are used in the treatment of anemia caused by CKD. This medication supplies a hormone typically created in the kidneys that signals the bone marrow to produce more red blood cells. In CKD, production of this hormone will be reduced.
Page Ref: 437
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

15) A client receiving peritoneal dialysis has a cloudy dialysate return. Which action by the nurse is the most appropriate and of highest priority?
A) Measure the client's abdominal girth.
B) Document the cloudy dialysate.
C) Culture the dialysate return.
D) Increase dialysate instillation.
Answer: C
Explanation: A) Measurement of abdominal girth is performed prior to the dialysis procedure, and increased girth could indicate peritonitis.
B) Documenting the cloudy dialysate would be a necessary nursing action but is not the next-priority action.
C) The client's dialysate return should be clear. The presence of cloudy drainage might indicate peritonitis, so the nurse should culture the return in order to help identify the presence and type of organism that could be causing the infection.
D) The instillation part of the procedure is completed prior to the collection of the dialysate return, and the rate of the instillation has no relationship to the development of an infection.
Page Ref: 443
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

16) A client received a kidney transplant 2 years ago. Which type of rejection is the client experiencing when treatment does not respond to increased immunosuppression?
A) Acute rejection
B) Chronic rejection
C) Delayed rejection
D) Nonimmune rejection
Answer: B
Explanation: A) Acute rejection develops within months of the transplant. It is caused by a cellular immune response and may be managed with methylprednisolone and OKT3 monoclonal antibody.
B) Chronic rejection, which may develop months to years following the transplant, is a major cause of graft loss. Chronic rejection does not respond to increased immunosuppression.
C) Delayed is not a type of rejection.
D) Nonimmune is not a type of rejection.
Page Ref: 440
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Identify the clinical manifestations of CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

17) The nurse is reviewing laboratory data for a client with a change in urine output. Which laboratory finding suggests the development of chronic kidney disease?
A) Increase in creatinine clearance
B) Increase in serum sodium
C) Increase in hematocrit
D) Decrease in BUN
Answer: B
Explanation: A) Laboratory findings associated with chronic kidney disease include decreased creatinine clearance due to a decrease in the glomerular filtration rate.
B) As the GFR decreases and renal function deteriorates further, sodium and water retention may occur, necessitating salt and water restrictions.
C) Hematocrit decreases due to decreased red blood cell production.
D) BUN increases due to inability of the kidneys to eliminate nitrogenous waste products.
Page Ref: 434
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Identify the clinical manifestations of CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

18) The nurse is assessing a client with chronic kidney disease (CKD). For which reason should the nurse be concerned when the client develops Kussmaul respirations?
A) It suggests the client is experiencing metabolic acidosis.
B) It suggests the client is dehydrated.
C) It suggests the client is hypotensive.
D) It suggests the client is experiencing proteinuria.
Answer: A
Explanation: A) Kussmaul respirations involve an increase in respiratory rate and depth. Clients with CKD may exhibit these respirations when they are experiencing metabolic acidosis related to impaired hydrogen ion excretion and buffer production.
B) Kussmaul respirations do not indicate dehydration in a client with CKD.
C) Kussmaul respirations do not indicate hypotension in the client with CKD.
D) Kussmaul respirations do not indicate proteinuria in a client with CKD.

Learning Outcome: 6.C. Analyze chronic kidney disease as it relates to fluids and electrolytes. Identify the clinical manifestations of CKD.
MNL LO: Demonstrate understanding of the concept of fluid and electrolytes in the care of a patient with chronic kidney disease.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e **(Pearson)**
Module 7 Health, Wellness, Illness, and Injury

The Concept of Health, Wellness, Illness, and Injury

1) The nurse identifies the components of wellness as a useful tool in assessing health. Which components of wellness will the nurse identify? **Select all that apply.**
A) Physical
B) Environmental
C) Emotional
D) Financial
E) Spiritual
Answer: A, B, C, D, E
Explanation: A) The physical component allows the person to engage in ADLs without experiencing undue fatigue or exhaustion. This component is supported through healthy behaviors.
B) The environmental component involves the ability to recognize one's responsibility to improve, protect, or preserve the quality of life in a community by being respectful of the surroundings.
C) The emotional component is the ability to manage stress and to express emotions appropriately.
D) Financial wellness requires effectively managing finances, spending within one's means, being prepared for emergencies, and having the tools necessary to make economic decisions.
E) The spiritual component is the belief in some force (nature, science, religion, or a higher power) that serves to unite human beings and provide meaning and purpose to life.

Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 7.1. Identify the dimensions of wellness and the determinants of health.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

W W . T B S M . W S

2) A nurse is preparing a workshop on the leading health indicators of population health identified by the Office of the Attorney General. Which topics should the nurse plan to address? **Select all that apply.**
A) Injury and violence
B) Genomics
C) Oral Health
D) Mental Health
E) Healthcare-Associated Infections
Answer: A, C, D
Explanation: A) Injury and violence is a leading indicator of population health in the United States.
B) Genomics is not identified as a leading indicator of population health in the United States.
C) Oral health is a leading indicator of population health in the United States.
D) Mental health is a leading indicator of population health in the United States.
E) Healthcare-Associated Infections is not identified as a leading indicator of population health in the United States.
Page Ref: 458
Cognitive Level: Understanding
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 7.4. Describe the national vision of health promotion.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

3) The nurse is assessing a young adult client who was recently diagnosed as pregnant. Which factor should the nurse identify as the greatest barrier to health promotion in this client?
A) Age of the client
B) Presence of the client's mother during the appointment
C) Pregnancy occurred as a result of rape
D) First pregnancy (primigravida)
Answer: C
Explanation: A) The age of the mother could be a factor that promotes a desire for health or causes the client to make unhealthy choices, depending on the client's situation.
B) The presence of the client's mother could be a factor that promotes a desire for health or causes the client to make unhealthy choices, depending on the client's situation.
C) Clients who are pregnant as a result of rape will have both physical and emotional barriers to health promotion.
D) Gravidity could be a factor that promotes a desire for health or causes the client to make unhealthy choices, depending on the client's situation.

Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 7.4. Describe the national vision of health promotion.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

4) The nurse is preparing a presentation on health beliefs and behaviors. Which nonmodifiable risk factors for illness will the nurse include in the content? **Select all that apply.**
A) Family health history
B) Diet
C) Exercise regimen
D) Ethnicity
E) Age
Answer: A, D, E
Explanation: A) Nonmodifiable risk factors for illness include family health history.
B) Diet is a modifiable risk factor for illness.
C) Exercise is a modifiable risk factor for illness.
D) Nonmodifiable risk factors for illness include ethnicity.
E) Nonmodifiable risk factors for illness include age.
Page Ref: 461
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 7.5. Differentiate variables influencing healthy lifestyle behaviors.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

5) The nurse is teaching a class about building positive relationships and learning skills to be open-minded and respectful to those with opposing opinions. Based on this data, on which component of wellness is the nurse focusing?
A) Physical
B) Social
C) Environment
D) Emotional
Answer: B
Explanation: A) Physical wellness allows a person to engage in activities of daily living without experiencing undue fatigue and exhaustion.
B) Social wellness requires the ability to trust and respect other people and leads to the creation of supportive partnerships and friendships.
C) Environmental wellness involves the ability to recognize one's responsibility to improve, protect, or preserve the quality of life in a community by being respectful of the surroundings.
D) Emotional wellness involves recognizing, accepting, and expressing feelings.
Page Ref: 450-451
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 7.1. Identify the dimensions of wellness and the determinants of health.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

6) The nurse is providing teaching related to health promotion for a group of older adults. On which topic should the nurse focus?
A) Food safety
B) Physical activity
C) Financial stability
D) Recreational activities
Answer: B
Explanation: A) Food safety is not a health promotion priority for older adults.
B) Physical activity is a health promotion priority for older adults. Remaining active and independent improves well-being and decreases consequences of acute and chronic illnesses.
C) Financial stability is not a health promotion priority for older adults.
D) Recreation activities are not a health promotion priority for older adults.
Page Ref: 459
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 7.4. Describe the national vision of health promotion.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

7) The nurse conducts teaching for a client recently diagnosed with type 2 diabetes mellitus. At the conclusion of the session, which client statement indicates that teaching has been effective?
A) "I will take medication for a week for this acute illness."
B) "I will have to take insulin for this disease every day for the rest of my life."
C) "This acute disease will become worse and lead to death."
D) "I will have to make dietary changes to manage this chronic disease."
Answer: D
Explanation: A) Not all clients diagnosed with type 2 diabetes mellitus require medication to manage the disease process.
B) Not all clients diagnosed with type 2 diabetes mellitus require medication, such as insulin, to manage the disease process.
C) Diabetes is chronic, not acute. Depending on the client's response to the disease, the outcome may not become worse or lead to death.
D) The client is aware that dietary changes will be needed to manage this chronic disease, indicating that the client understands the teaching the nurse provided.
Page Ref: 462
Cognitive Level: Evaluating
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 7.2. Explain illness and injury, the impact of health disparities, and effects on patients, families, and communities.

MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

8) An occupational health nurse for a large corporation is planning programs to address health lifestyle behaviors. Which information will the nurse provide? **Select all that apply.**
A) Maintaining a healthy diet
B) Restricting physical activity
C) Avoiding all tobacco products
D) Drinking alcohol in moderation
E) Sleeping 7 to 9 hours each night
Answer: A, C, D, E
Explanation: A) Recommendations and rationales for healthy lifestyle behaviors include maintaining a healthy diet.
B) Recommendations and rationales for healthy lifestyle behaviors include engaging in regular physical activity.
C) Recommendations and rationales for healthy lifestyle behaviors include avoiding all tobacco products.
D) Recommendations and rationales for healthy lifestyle behaviors include drinking alcohol in moderation or not at all.
E) Recommendations and rationales for healthy lifestyle behaviors include sleeping 7 to 9 hours each night.
Page Ref: 461-462
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 7.4. Describe the national vision of health promotion.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

9) After conducting a physical assessment with an adult client, the nurse realizes the client follows health practices from an unfamiliar culture. Which action should the nurse take?
A) Repeat the assessment later in the day.
B) Determine the culture with which the client identifies.
C) Write a nursing diagnosis to address the unfamiliar beliefs and actions.
D) Communicate the findings to the healthcare team.
Answer: B
Explanation: A) Repeating the assessment will most likely result in the same data.
B) A thorough assessment that includes assessment of cultural beliefs and practices is needed before proceeding with other steps of the nursing process. Behavior that is considered uncommon in one cultural context may be considered desirable in another.
C) Writing a nursing diagnosis or communicating findings before investigating the client's culture would be premature.
D) There is no reason to share the information with others until the cultural group is identified.
Page Ref: 464
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 7.5. Differentiate variables influencing healthy lifestyle behaviors.

MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

10) The nurse is caring for a client with chronic obstructive pulmonary disease (COPD). On which health promotion concept will the nurse focus teaching?
A) Safety
B) Elimination
C) Immunity
D) Development
Answer: A
Explanation: A) COPD often develops as a result of years of smoking, and one common therapy is oxygen administration. The combination of smoking and oxygen increases the client's risk for safety related to fire hazards.
B) COPD does not commonly cause changes in elimination.
C) COPD does not commonly cause changes in immunity.
D) COPD does not commonly cause changes in development.
Page Ref: 456
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.3. Outline the concepts related to health, wellness, illness, and injury.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

11) The nurse cares for clients in a community clinic. Which nursing interventions exemplify the nurse working in a health promotion role? **Select all that apply.**
A) Administering a prescribed antibiotic
B) Reinforcing desirable changes to the client's lifestyle
C) Administering vaccines to a well child
D) Administering an inhaler to a client with asthma
E) Obtaining a blood glucose sample on a client with hypoglycemia
Answer: B, C
Explanation: A) Administering an ordered antibiotic exemplifies a nursing intervention that is in response to disease or illness.
B) The nurse acting in a health promotion role is performing interventions to prevent disease. Reinforcing desirable changes to the client's lifestyle is acting in a health promotion role.
C) Administering vaccines to a well child is a health promotion activity.
D) Giving medications is an act in response to an illness or disease.
E) Obtaining a blood glucose sample is done in response to disease or illness.
Page Ref: 459
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 7.4. Describe the national vision of health promotion.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

12) A community health nurse is teaching a group of clients on the difference between illness and disease. Which statements are appropriate for the nurse to include in the educational session? **Select all that apply.**

A) "An individual can have a disease and not feel ill."
B) "Illness is synonymous with disease."
C) "Illness is an alteration in body function, where disease is highly subjective."
D) "An individual can feel ill without disease."
E) "Illness and disease are never related to one another."

Answer: A, D

Explanation: A) People can feel ill without having a discernible disease.
B) Illness is not another term for disease.
C) Illness is the experience of being unhealthy or unwell. A disease is a disorder of structure or function in an organ(s) or body system(s).
D) An individual can feel ill–that is, feel uncomfortable–and yet have no discernible disease.
E) Illness symptoms and disease processes do often co-occur and are classified based on how they occur.

Page Ref: 452
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.2. Explain illness and injury, the impact of health disparities, and effects on patients, families, and communities.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

13) The nurse is preparing to care for a client. Which concept will the nurse use to identify habits of health and wellness and the effects of illness and injury?

A) Assessment
B) Collaboration
C) Teaching and learning
D) Advocacy
Answer: A
Explanation: A) As the first step in the nursing process, the nurse will use assessment with every client to identify habits of health and wellness and the effects of illness and injury.
B) Collaboration does not help identify healthy habits or the effects of illness and injury.
C) Teaching and learning does not help identify healthy habits or the effects of illness and injury.
D) Advocacy does not help identify healthy habits or the effects of illness and injury.
Page Ref: 467
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.B.1. Elicit patient values, preferences and expressed needs as part of clinical interview, implementation of care plan and evaluation of care. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Assessment
Learning Outcome: 7.3. Outline the concepts related to health, wellness, illness, and injury.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

14) The nurse is assessing a client. On which criteria will the nurse focus for health promotion activities?

A) Culture
B) Lifestyle
C) Spiritual beliefs
D) Socioeconomic status
Answer: B
Explanation: A) Culture is not an area on which to focus for health promotion.
B) Health promotion involves nursing assessment of a client's lifestyle and implementation of needed changes to that lifestyle.
C) Spiritual beliefs are not an area on which to focus for health promotion.
D) Socioeconomic status is not an area on which to focus for health promotion.
Page Ref: 461-462
Cognitive Level: Understanding
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.B.10. Engage patients or designated surrogates in active partnerships that promote health, safety and well-being, and self-care management. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Assessment, Assessment
Learning Outcome: 7.6. Apply the nursing process to identify health promotion needs.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

15) The nurse is reviewing data collected for a client desiring to improve current health status. Which problem statement will the nurse identify for this client?
A) Risk for illness
B) Wellness strength
C) Altered health status
D) Desire for information
Answer: B
Explanation: A) The client is not at a risk for an illness.
B) A wellness strength is willingness to make a change to improve health.
C) There is no evidence that the client has an altered health status.
D) There is no evidence that the client desires information.
Page Ref: 468
Cognitive Level: Understanding
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.B.10. Engage patients or designated surrogates in active partnerships that promote health, safety and well-being, and self-care management. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Diagnosis
Learning Outcome: 7.6. Apply the nursing process to identify health promotion needs.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

Exemplar 7.A Physical Fitness and Exercise

1) The nurse is preparing a teaching tool about the benefits of exercise. Which impact will the nurse explain that exercise has on the gastrointestinal system?
A) Use of fatty acids
B) Insulin responsiveness
C) Enhance the gut microbiome
D) Reduction of polyp formation
Answer: C
Explanation: A) Exercise does not impact use of fatty acids.
B) Insulin responsiveness is an effect of exercise on the endocrine system.
C) Exercise has a critical role in the maintenance of gut health and metabolism. The gastrointestinal tract is inhabited by trillions of microorganisms (microbiome) that impact intestinal function. Recent studies suggest that exercise enhances the gut microbiome, which improves lipid and carbohydrate metabolism; these benefits lead to a reduction in risk of colon cancer, inflammatory bowel disease, obesity, and metabolic diseases.
D) There is no evidence that exercise impacts the development of polyps.
Page Ref: 473
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.1 Demonstrate an understanding of the discipline of nursing's distinct perspective and where shared perspectives exist with other disciplines. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 7.A. Analyze physical fitness and exercise as they relate to health, wellness, illness, and injury. Outline the effects of exercise on body systems.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

2) The nurse is providing wellness teaching to a client who is interested in beginning an exercise program to reduce certain health risks. The nurse determines that the client understands the teaching when the client selects which health risks that can be reduced by regular exercise? **Select all that apply.**

A) Liver disease
B) Type 2 diabetes
C) Cardiovascular disease
D) Dementia
E) Renal disease

Answer: B, C, D

Explanation: A) Regular physical activity does not decrease the risk of liver disease.
B) Regular physical activity results in a decreased risk of type 2 diabetes.
C) Regular physical activity results in a decreased risk of cardiovascular disease.
D) Regular physical activity results in a decreased risk of dementia.
E) Regular physical activity does not decrease the risk of renal disease.

Page Ref: 473
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 7.A. Analyze physical fitness and exercise as they relate to health, wellness, illness, and injury. Describe the benefits of physical fitness.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

3) The nurse is providing care to an older adult client who was recently diagnosed with early osteoporosis. Which intervention is most appropriate for the nurse to implement with this client?
A) Providing the client with assisted range of motion exercising twice daily
B) Instituting an exercise plan that includes weight-bearing activities
C) Protecting the client's bones with strict bedrest
D) Increasing the amount of calcium in the client's diet
Answer: B
Explanation: A) Assisted range of motion exercises are not weight bearing and do not help delay or reverse osteoporosis.
B) Osteoporosis is a demineralization of the bone in which calcium leaves the bone matrix. One causative factor is lack of weight-bearing activity. Weight bearing helps to move calcium back into the bone, thereby strengthening it. A standard intervention for those attempting to prevent or reverse osteoporosis is beginning an exercise plan that includes weight-bearing activities.
C) Strict bedrest may well make the osteoporosis worse because there is no weight-bearing activity.
D) Additional calcium in the diet after osteoporosis has begun is not thought to be effective.
Page Ref: 473
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.A. Analyze physical fitness and exercise as they relate to health, wellness, illness, and injury. Outline the effects of exercise on body systems.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

4) A school nurse is reviewing the physical activity for adolescent high school students. Which student has met the outcome for physical activity set by the Centers for Disease Control and Prevention (CDC)?
A) An 18-year-old who speed-walks 60 minutes once per week
B) A 16-year-old who lifts moderately heavy weights for 15 minutes 3 times per week
C) A 15-year-old who runs at a fast pace for 20 minutes 2 times per week
D) A 17-year-old who alternates aerobic activities for 60 minutes daily and lifts weights 2 times per week
Answer: D
Explanation: A) Speed walking once a week does not meet the guidelines.
B) Lifting weights for 15 minutes 3 times a week does not meet the guidelines.
C) Running for 20 minutes 2 times a week does not meet the guidelines.
D) The recommendations for physical activity for adolescents are 60 minutes of physical activity almost every day, with vigorous activity at least 3 days per week and inclusion of muscle strengthening activities.
Page Ref: 474
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 7.A. Analyze physical fitness and exercise as they relate to health, wellness, illness, and injury. Summarize the recommendations for physical activity across the lifespan.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

5) The pulmonary rehabilitation nurse is teaching a group of clients about both isotonic and isometric exercises. At the conclusion of the session, which client statements indicate effective teaching has occurred? **Select all that apply.**

A) "Isotonic exercises require muscle movement."
B) "Isotonic exercises build bone density."
C) "Isometric exercises can be adapted for mobility-impaired individuals."
D) "Isotonic exercises produce a mild increase in heart rate and cardiac output, but no appreciable increase in blood flow to other parts of the body."
E) "Isometric exercises are a controlled form of strength training."

Answer: A, B, C, E

Explanation: A) Isotonic exercises are exercises that require muscle movement.
B) Isotonic exercises build bone density.
C) Isometric exercises strengthen and stretch the body, and they can be safely adapted for individuals who are mobility-impaired.
D) Isometric exercises produce a mild increase in heart rate and cardiac output.
E) Isokinetic exercises are a controlled form of strength training.

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 7.A. Analyze physical fitness and exercise as they relate to health, wellness, illness, and injury. Contrast the types of exercise.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

6) The nurse is preparing a teaching tool about exercise for a community health fair. Which categories of exercise should the nurse include in this tool? **Select all that apply.**
A) Interval
B) Adapted
C) Strength
D) Flexibility
E) Endurance
Answer: A, C, D, E
Explanation: A) Interval training is alternating short bursts of higher-intensity activity into a sustained aerobic workout.
B) Adapted is not a category of exercise.
C) Strength training are exercises that use resistance to strengthen muscle groups.
D) Flexibility training is the use of exercises intended to improve muscle elasticity and length, joint structure, and balance.
E) Endurance training are aerobic activities that increase heart rate, respiratory rate, and metabolism.

Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 7.A.2. Analyze physical fitness and exercise as they relate to health, wellness, illness, and injury. Contrast the types of exercise.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

WwW.TeSt.Ws

7) The nurse is planning physical fitness and exercise recommendations for a 27-year-old pregnant woman at 16 weeks' gestation. Which recommendation should the nurse make?
A) Restrict activity to twice a week.
B) Obtain 150 minutes of moderate-intensity aerobic activity each week.
C) Focus on walking as the main activity.
D) Use a stationary bicycle for physical activity.
Answer: B
Explanation: A) There is no need to restrict activity to twice a week when pregnant.
B) Pregnant women should engage in at least 150 minutes of moderate physical activity each week. They can engage in vigorous physical activity if that is already part of their routine.
C) Walking does not need to be the main activity.
D) A stationary bicycle does not need to be used for physical activity when pregnant.
Page Ref: 474
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.B.10. Engage patients or designated surrogates in active partnerships that promote health, safety and well-being, and self-care management. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 7.A. Analyze physical fitness and exercise as they relate to health, wellness, illness, and injury. Summarize the recommendations for physical activity across the lifespan.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

Exemplar 7.B Oral Health

1) During a well-child checkup, the parent of a young school-age child reports that well water is used in their community. Which statement should the nurse prioritize when teaching?
A) "Your child will need to use a teeth whitener in the future because well water is your primary water source."
B) "Your child will need to be placed on a fluoride supplement because your primary water source is from a well."
C) "I will recommend some mouthwashes that are appropriate for clients who drink well water."
D) "It will be very important that your child does not eat sugary foods because you drink well water."
Answer: B
Explanation: A) Teeth whitener is not required for a child who drinks well water.
B) Inquire about use of fluoride if the water supply is not fluoridated. Well water does not contain fluoride.
C) Special mouthwashes are not required for a child who drinks well water.
D) Refraining from sugary foods is not necessary just because the child's primary drinking source is from a well.
Page Ref: 477
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.B. Analyze oral health as it relates to health, wellness, illness, and injury. Describe the significance of oral hygiene across the lifespan.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

2) The nurse is reviewing the anatomy and physiology of the teeth with a group of students. Which part of the tooth should the nurse identify that wears away, allowing dental decay?
A) Pulp cavity
B) Enamel
C) Gingiva
D) Root
Answer: B
Explanation: A) The pulp cavity can become damaged after the enamel has worn away.
B) Enamel is a hard substance that covers the outside of the tooth to protect it from damage and decay. Enamel wears away over time, allowing dental damage and decay in the form of dental caries.
C) Gingiva is another term for gums; the gums are not part of the teeth but instead help cover the roots and hold the teeth in place.
D) Roots can become damaged after the enamel has worn away.
Page Ref: 476
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 7.B. Analyze oral health as it relates to health, wellness, illness, and injury. Describe the functions of the oral cavity and normal oral health.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

3) A client in the intensive care unit who is intubated and mechanically ventilated has cheilosis. Which action should the nurse take?
A) Check for ill-fitting dentures
B) Suggest an increase in fluid intake
C) Provide oral care
D) Lubricate the lips using an antimicrobial ointment
Answer: D
Explanation: A) The client would not have dentures in place when intubated.
B) Suggesting an increase to the client's fluid intake would be appropriate for a client with dry mucous membranes.
C) Oral care will not help cheilosis.
D) Cheilosis is when the lips are cracked. The priority nursing intervention for this client is to lubricate the lips with antimicrobial ointment to prevent infection.
Page Ref: 477
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.B. Analyze oral health as it relates to health, wellness, illness, and injury. Identify commonly occurring alterations in oral health.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

4) The nurse is caring for a client with glossitis secondary to nutritional deficiencies. Based on this data, which is the priority focus of this client's care?
A) Upper lip
B) Upper teeth
C) Uvula
D) Tongue
Answer: D
Explanation: A) Glossitis is the inflammation of the tongue and does not involve the lips.
B) Glossitis is the inflammation of the tongue and does not involve the teeth.
C) Glossitis is the inflammation of the tongue and does not involve the uvula.
D) Glossitis is the inflammation of the tongue.
Page Ref: 477
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.B. Analyze oral health as it relates to health, wellness, illness, and injury. Identify commonly occurring alterations in oral health.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

5) A pediatric nurse is caring for a toddler at a well-child clinic. When providing education regarding the client's oral health, which topics are appropriate for the nurse to include? **Select all that apply.**

A) Instructions on avoiding prolonged bottle feeding during naps and at bedtime.
B) Instructions on brushing the client's teeth once daily.
C) Hazards of fluoride use in tooth development.
D) Instructions on eliminating the client's milk consumption.
E) Instructing the parents that the client needs dental care prior to when the client begins to lose the primary teeth.

Answer: A, E

Explanation: A) Prolonged bottle feeding should be avoided because it can contribute to dental caries.
B) The client's teeth should be brushed after meals.
C) Fluoride should be used for those with non-fluoridated water and does not pose a risk in tooth development.
D) The client does not need to eliminate milk consumption.
E) Many parents are unaware of the importance of dental health in very young children. They may see their child's teeth as "baby teeth" and think they can put off dental visits until the child begins to lose the primary teeth. Nurses working with parents of very young children may need to help the parents learn that care of primary teeth is essential to healthy permanent teeth.

Page Ref: 477
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.B. Analyze oral health as it relates to health, wellness, illness, and injury. Describe the significance of oral hygiene across the lifespan.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

6) The nurse is working with a family that is new to the pediatric practice. Which topics will the nurse include when teaching the mother how to decrease the development of dental caries in an infant? **Select all that apply.**
A) Refraining from giving the infant a bottle for a prolonged time at bedtime
B) Giving the infant sugar water only at breakfast time
C) Wiping the infant's gums with soft moist gauze once or twice daily
D) Using a toothbrush as soon as the first tooth erupts
E) Using a topical anesthetic daily, beginning as soon as the first tooth begins to erupt
Answer: A, C
Explanation: A) Interventions appropriate for prevention of dental caries include avoiding prolonged bottle feeding at bedtime.
B) Foods high in sugar should be avoided for the infant at all times.
C) Interventions appropriate for prevention of dental caries include wiping the gums with a soft moist gauze.
D) A toothbrush should not be used during infancy.
E) Topical anesthetic should not be applied daily.
Page Ref: 477
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.B. Analyze oral health as it relates to health, wellness, illness, and injury. Describe the significance of oral hygiene across the lifespan.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

7) The nurse is caring for a client in a long-term care facility. Which expected outcome should the nurse identify when the client has difficulty completing self-care?
A) The client will be able to name the staff that works on the day shift.
B) The client, with supervision, will brush teeth twice per day.
C) The client will eliminate safety hazards in the environment.
D) The nurse will stress the importance of adequate fluid intake.
Answer: B
Explanation: A) Naming the staff will not help with self-care.
B) A client with cognitive impairment would be able to brush the teeth, but only with supervision. The client would not voluntarily brush the teeth without prompting from the staff.
C) Eliminating safety hazards will not help with self-care.
D) An adequate fluid intake will not help with self-care.
Page Ref: 480
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 7.B. Analyze oral health as it relates to health, wellness, illness, and injury. Outline nursing management of oral health including identifying patients at risk and promoting oral hygiene.

MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

Exemplar 7.C Normal Sleep-Rest Patterns

1) The nurse notes that during sleep, an acutely ill client has blood pressure, heart rate, and respirations below baseline. Which conclusion should the nurse make regarding this information?
A) The client is about to have a cardiac arrest.
B) The client is in NREM sleep.
C) The client's metabolic rate has increased.
D) The client is in REM sleep.
Answer: B
Explanation: A) The client is not necessarily at risk for cardiac arrest.
B) During NREM sleep, the client is relaxed, and body functions are decreased. A decrease in vital signs is normal during NREM sleep.
C) During NREM sleep, body functions are decreased, including metabolic rate.
D) REM sleep is characterized by increased body function and elevated vital signs.
Page Ref: 482
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 7.C. Analyze sleep and rest as they relate to health, wellness, illness, and injury. Describe the physiology and functions of sleep.

MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

2) A new mother is concerned that the baby's "eyes dart around the eyelids and has irregular breathing" when asleep. Which response should the nurse make?
A) "Please bring your baby in immediately for a checkup."
B) "You should ask the doctor about these symptoms at your next checkup."
C) "These are common behaviors in newborns and are normal."
D) "If your baby does this again, take her to the emergency department."
Answer: C
Explanation: A) There is no need for an immediate checkup.
B) Having the mother wait until the next checkup unnecessarily delays this reassurance.
C) These are indications of normal REM sleep in the newborn. The mother should be reassured that this is normal.
D) There is no need for an immediate trip to the emergency department.
Page Ref: 483
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.C. Analyze sleep and rest as they relate to health, wellness, illness, and injury. Describe variations in sleep patterns across the lifespan.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

3) A client reports having difficulty sleeping. Which recommendation should the nurse make for this client?
A) Eat a small snack before bedtime.
B) Take an over-the-counter sleep aid such as melatonin.
C) Set a routine time to go to bed and a routine time to get out of bed.
D) Do a calming activity in bed before trying to sleep, such as reading a book.
Answer: C
Explanation: A) Eating a small snack before bed is not recommended to promote sleep.
B) Although taking an over-the-counter sleep aid may help promote sleep, it should not be a first-line treatment recommendation.
C) The most important change to make in a bedtime routine is to set a routine mandatory time to go to bed and set a routine mandatory time to get out of bed. The client needs to train his mind and body to expect to sleep on this schedule.
D) Using the bed for activities other than sleep and sex are not recommended to promote sleep.
Page Ref: 485
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 7.C. Analyze sleep and rest as they relate to health, wellness, illness, and injury. Plan interventions that promote normal sleep.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

4) The parent of an adolescent client expressed concern regarding the adolescent's sleeping habits. Which assessment findings indicate to the nurse that the adolescent client is sleep deprived? **Select all that apply.**
A) Consumption of caffeinated soda
B) Difficulty waking in the morning for school
C) Irritability and anxiety, especially on days with less sleep
D) Trouble initiating or persisting in projects, such as school assignments
E) Refusal to participate in sports activities
Answer: A, B, C, D
Explanation: A) High caffeine consumption is associated with a variety of adolescent health issues like insomnia, which can lead to sleep deprivation.
B) Sleep deprivation may cause the adolescent to have trouble waking in the morning for school.
C) Other symptoms of sleep deprivation include irritability and anxiety.
D) Other symptoms of sleep deprivation include problems associated with attention, memory, and decision making.
E) Sports participation is not correlated to sleep deprivation.
Page Ref: 484
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 7.C. Analyze sleep and rest as they relate to health, wellness, illness, and injury. Describe variations in sleep patterns across the lifespan.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

5) An adult client asks for suggestions to improve sleep. Which recommendations should the nurse make? **Select all that apply.**
A) Limit the use of alcohol to early in the evening
B) Have a cup of tea before bed in order to enhance relaxation
C) Adjust the room temperature to a comfortable level for sleep
D) Change the time of aerobic exercise to 1 hour prior to sleep
E) Limit cigarette smoking before bedtime
Answer: A, C, E
Explanation: A) Alcohol interferes with REM sleep, and its consumption should be limited to well before bedtime.
B) Tea contains caffeine, which is a stimulant. The nurse could suggest non-caffeinated tea before bedtime unless this causes the client to wake during the night to urinate.
C) A comfortable room temperature will promote sleep.
D) Exercise close to bedtime acts as a stimulant and can cause the client to be unable to sleep.
E) Nicotine is a stimulant and may prevent the client from falling asleep.
Page Ref: 485
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 7.C. Analyze sleep and rest as they relate to health, wellness, illness, and injury. Outline factors affecting sleep.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

6) The nurse is caring for a newborn who is sleeping. Which information about sleep in a newborn is inaccurate?
A) A newborn will have an irregular sleep schedule with periods of 1-3 hours spent awake.
B) NREM sleep in a newborn is characterized by regular respirations, closed eyes, and the absence of body and eye movements.
C) REM sleep occurs gradually in a newborn.
D) NREM sleep is also called quiet sleep during the newborn period.
Answer: C
Explanation: A) Newborns sleep on an irregular schedule with periods of 1-3 hours spent awake.
B) NREM sleep is characterized by regular respirations, closed eyes, and the absence of body and eye movements.
C) Unlike older children and adults, newborns enter REM sleep immediately.
D) NREM sleep is also called quiet sleep during the newborn period.

Learning Outcome: 7.C. Analyze sleep and rest as they relate to health, wellness, illness, and injury. Describe variations in sleep patterns across the lifespan.
MNL LO: Analyze the concept of health, wellness, and illness and its application to nursing care.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e **(Pearson)**
Module 8 Immunity

The Concept of Immunity

1) A client with a systemic infection asks which defenses the body has against infection. Which physiologic barriers should the nurse include in the response to the client? **Select all that apply.**
A) The spleen
B) Adequate urinary output
C) Intact skin
D) Generalized inflammation
E) The thymus gland
Answer: B, C
Explanation: A) The spleen is part of the immune system; however, it is not a physiologic barrier but rather an internal organ in which lymphoid cells proliferate and/or mature.
B) The membranes lining the inner surfaces of the body are protected by a barrier of mucus, which traps microorganisms and other foreign substances. These can then be removed by other protective mechanisms, such as the washing action of urine.
C) Barrier protection is the body's first line of defense against infection. The skin is the primary barrier; when intact, it prevents invasion by external organisms.
D) Although the inflammatory response helps fight infection, it occurs when the body's physiologic barriers to microorganisms have already been breached.
E) The thymus gland is an internal organ of the immune system; however, it is not considered a physiologic barrier.

Page Ref: 496
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.1 Demonstrate an understanding of the discipline of nursing's distinct perspective and where shared perspectives exist with other disciplines. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.1. Analyze the physiology of immunity in the body.
MNL LO: Analyze the concept of immunity and its application to nursing care.

2) A client who receives a vaccination of a live virus before foreign travel asks how the vaccine provides protection. Which responses by the nurse are most appropriate? **Select all that apply.**
A) "Human macrophages engulf the weakened vaccine virus as if it is dangerous, and antigens stimulate the immune system to attack it."
B) "In the lymph nodes, which are part of the lymphoid system, the macrophages present antigens of the virus to T cells and B cells."
C) "A response from yellow fever—specific T cells is activated. B cells secrete yellow fever antibodies."
D) "The vaccine contains large amounts of protective antibodies that were produced in another host organism, so it provides immediate protection against yellow fever."
E) "The initial weak infection is eliminated, and the client is left with a supply of memory T and B cells for future protection against yellow fever."
Answer: A, B, C, E
Explanation: A) Administration of the vaccine introduces a small number of weakened viruses into the body. Macrophages ingest these viruses while also presenting the viruses' antigens to T cells and B cells.
B) Exposure to the antigens causes the T cells to attack the viruses.
C) Exposure to the antigens triggers the B cells to begin secreting antibodies, which attack and destroy the antigens.
D) In this way, vaccination leads to the development of active immunity, unlike administration of large amounts of antibodies that were produced in another host, which is a type of passive immunity.
E) The initial weak infection is eliminated, and the body is left with a supply of memory T and B cells that provide future protection against the virus.

Page Ref: 506
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.1. Analyze the physiology of immunity in the body.
MNL LO: Analyze the concept of immunity and its application to nursing care.

3) The nurse is caring for clients in the emergency department. Which client demonstrates a declining immune response that typically occurs with the aging process?
A) An 88-year-old client with pneumonia who has a temperature of 99.5°F
B) A 70-year-old client who has swelling and redness around an abdominal incision from an open appendectomy
C) A 58-year-old client who complains of redness and itching after developing a rash from contact with poison ivy
D) A 56-year-old client who has 8 mm induration at the site of a PPD skin test administered 72 hours earlier
Answer: A
Explanation: A) The client who has only a slight elevation in temperature in response to pneumonia is exhibiting a decline in the expected immune response.
B) Swelling and redness is an expected immune response.
C) Redness is an expected immune response.
D) Induration is an expected immune response.
Page Ref: 496
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.8. Differentiate considerations related to the assessment and care of patients with alterations in immunity throughout the lifespan.
MNL LO: Analyze the concept of immunity and its application to nursing care.

4) The nurse is conducting a physical assessment for a client with a compromised immune system. Which actions by the nurse are appropriate? **Select all that apply.**
A) Assessing general appearance
B) Recommending increased fluid intake
C) Inspecting the mucous membranes of the nose and mouth
D) Palpating the cervical lymph nodes
E) Checking joint range of motion (ROM), including that of the spine
Answer: A, C, D, E
Explanation: A) Before conducting the interview, the nurse should review the client's biographical data, including age, sex, race, and ethnic background. The nurse would then observe the general appearance of the client and note whether the client's stated and apparent age coincide.
B) Although recommending that the client increase fluid intake may be an appropriate intervention, it is not an action that is conducted during the physical assessment for this client.
C) The mucous membranes of the nose and mouth should be inspected for color and condition.
D) The cervical lymph nodes should be palpated for swelling or tenderness.
E) The client's ROM, including that of the spine should be assessed.
Page Ref: 509-511
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 8.5. Differentiate common assessment procedures and tests used to examine immune function.
MNL LO: Analyze the concept of immunity and its application to nursing care.

5) A client seeks medical attention for a foot infection caused by stepping on a rusty nail. Which treatment option does the nurse anticipate for this client?

A) Toxoid

B) Live virus vaccine

C) Inactivated virus vaccine

D) Recombinant form vaccine

Answer: A

Explanation: A) A toxoid vaccine is created by treating a microorganism toxin with heat or chemical to weaken the toxic effects but retain antigenicity. Boosters are typically required to maintain ongoing protection against diseases.

B) A live virus vaccine contains a weakened form of the microorganism that causes a disease such as measles and varicella vaccines.

C) An inactivated virus vaccine contains the killed version of the microorganism that causes a disease but is still capable of inducing the human body to produce antibodies, like the inactivated poliovirus vaccine.

D) A recumbent form of a vaccine is made from two or more sources and genetically alters an organism to be used in a vaccine. An example of this is the hepatitis B vaccine.

Page Ref: 506

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 8.1. Analyze the physiology of immunity in the body.

MNL LO: Analyze the concept of immunity and its application to nursing care.

6) The nurse is providing care to a client with a compromised immune system. Which independent nursing intervention should the nurse include in the client's plan of care?

A) Educating the client on the importance of a nutritious diet
B) Administering corticosteroids per order
C) Prescribing prophylactic antibiotic therapy
D) Recommending gene transfer therapy

Answer: A

Explanation: A) Although all of these interventions may be appropriate for a client with a compromised immune system, the only independent nursing intervention is educating the client on the importance of a nutritious diet.

B) It is outside the scope of nursing practice to prescribe medication and to recommend therapies.

C) It is outside the scope of nursing practice to prescribe medication and to recommend therapies.

D) It is outside the scope of nursing practice to prescribe medication and to recommend therapies.

Page Ref: 512

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 8.6. Analyze independent interventions nurses can implement for patients with alterations in immunity.

MNL LO: Analyze the concept of immunity and its application to nursing care.

7) The nurse is caring for a client with leukocytosis. Which action by the nurse is most appropriate?
A) Instructing the client on the use of an electric razor and soft toothbrush
B) Evaluating the client for bleeding and bruising
C) Assessing the client for the source of infection
D) Placing the client in reverse isolation
Answer: C
Explanation: A) Providing instruction on the use of an electric razor and soft toothbrush would be appropriate actions for a client with thrombocytopenia, or decreased platelet levels.
B) Evaluating for bleeding and bruising would be appropriate actions for a client with thrombocytopenia, or decreased platelet levels.
C) A client with leukocytosis has a white blood cell (WBC) count that is elevated above normal (>10,000 mm^3), which is an indication of infection. The appropriate action by the nurse is to assess the client for the source of infection.
D) Reverse isolation would be appropriate for a client with neutropenia, or a decrease in the number of neutrophils.
Page Ref: 490
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.1. Analyze the physiology of immunity in the body.
MNL LO: Analyze the concept of immunity and its application to nursing care.

8) An adolescent client is having a routine health assessment. Which immunizations should the nurse anticipate administering to the client during this visit? **Select all that apply.**
A) Herpes zoster vaccine
B) Papillomavirus vaccine
C) Rotavirus vaccine
D) Meningococcal vaccine
E) Hepatitis B vaccine
Answer: B, D
Explanation: A) The herpes zoster vaccine is typically given to older adults.
B) The papillomavirus vaccine is administered during adolescence.
C) The rotavirus vaccine is usually administered to infants.
D) The meningococcal vaccine is administered during adolescence.
E) The hepatitis B vaccine is usually administered to infants.
Page Ref: 508
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 8.1. Analyze the physiology of immunity in the body.
MNL LO: Analyze the concept of immunity and its application to nursing care.

9) The parents of a toddler are concerned because the child experiences frequent infections. Which response should the nurse make?

A) Cell-mediated immunity doesn't achieve full function until a child is roughly 5 years old.

B) The thymus doesn't begin to function until adolescence, so prior to this time, children don't produce enough T cells to adequately protect them from infectious agents.

C) Children don't develop all of the immunoglobulins they need to protect against infection until they are about 6 or 7 years of age.

D) Young children have comparatively small lymphoid tissues, which means they are less able to fight infection than are older children.

Answer: C

Explanation: A) Cell-mediated immunity achieves full function early in life.

B) The thymus begins producing T cells during the fetal period.

C) Children do not develop adequate levels of certain immunoglobulins (namely, IgA, IgE, and IgG) until they are 6 or 7 years old, so prior to this time, they are at increased risk of infection.

D) Young children have lymphoid tissues that are quite large in comparison to the rest of their bodies.

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 8.8. Differentiate considerations related to the assessment and care of patients with alterations in immunity throughout the lifespan.

MNL LO: Analyze the concept of immunity and its application to nursing care.

10) The nurse is creating a teaching tool about the immune system. Which cells would the nurse classify as granulocytes?
A) Helper T cells
B) Macrophages
C) Natural killer (NK) cells
D) Eosinophils
Answer: D
Explanation: A) Helper T cells are both lymphocytes, not granulocytes.
B) Macrophages are mature monocytes and would not be classified as granulocytes.
C) NK cells are both lymphocytes, not granulocytes.
D) There are three types of granulocytes: neutrophils, eosinophils, and basophils.
Page Ref: 491
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 8.1. Analyze the physiology of immunity in the body.
MNL LO: Analyze the concept of immunity and its application to nursing care.

11) Three weeks after receiving a donor liver, a client begins to experience fever, tachycardia, right upper quadrant pain, and increased accumulation of fluid in the abdomen. Which condition will the nurse expect the client is experiencing when the transplanted liver becomes dangerously enlarged?
A) Hyperacute rejection
B) Chronic rejection
C) Acute rejection
D) Delayed rejection
Answer: C
Explanation: A) Hyperacute rejection occurs within minutes or hours of transplantation and is characterized by organ swelling, clot formation, and hemorrhage.
B) Chronic rejection occurs months after transplantation and involves slow, insidious organ failure.
C) Acute rejection occurs in the weeks following transplantation and is marked by pain, swelling, and enlargement of the transplanted organ.
D) Delayed is not a type of organ rejection.
Page Ref: 502

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.2. Differentiate alterations in immunity.
MNL LO: Analyze the concept of immunity and its application to nursing care.

12) The nurse is preparing a teaching tool about the lymphoid organs. Which organ will the nurse identify as the largest lymphoid organ in the body?
A) Thymus gland
B) Bone marrow
C) Tonsils
D) Spleen
Answer: D
Explanation: A) The thymus gland is a lymphoid organ; however, it is not the largest.
B) Bone marrow is not an organ, but rather a tissue with several lymphoid functions.
C) The tonsils are lymphoid organs; however, they are not the largest.
D) The spleen is the largest lymphoid organ in the body.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 8.1. Analyze the physiology of immunity in the body.
MNL LO: Analyze the concept of immunity and its application to nursing care.

13) The nurse is reviewing the different types of transfusion reactions before providing a client with packed red blood cells. As which type of hypersensitivity reaction should the nurse categorize transfusion reactions and Rh incompatibility?
A) Type I
B) Type II
C) Type III
D) Type IV
Answer: B
Explanation: A) Type I, or immediate hypersensitivity, reactions are characterized by rapid development of symptoms after exposure to an antigen; an example is anaphylaxis.
B) Type II, or cytotoxic hypersensitivity, reactions involve the rupture of cells targeted by the immune response that may affect a variety of organs and tissues; examples include transfusion reactions and Rh incompatibility.
C) Type III, or immune-complex, reactions include inflammatory response in the targeted tissues that leads to tissue damage; examples include autoimmune disorders such as systemic lupus erythematosus (SLE) and rheumatoid arthritis (RA).
D) Type IV, or delayed-type hypersensitivity, reactions involve a major histocompatibility complex and are characterized by tissue damage at the site of antigen contact within 24-48 hours of exposure; an example is allergic contact dermatitis.
Page Ref: 502
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 8.1. Analyze the physiology of immunity in the body.
MNL LO: Analyze the concept of immunity and its application to nursing care.

14) A new mother asks why breastfeeding will help prevent the baby from developing infections. Which response should the nurse make?

A) The infant receives maternal antibodies via breastmilk, and these antibodies stimulate the infant's immune system to begin producing antibodies of its own.

B) Consumption of breastmilk introduces certain antigens into the infant's body, thereby stimulating the infant's immune system to begin producing antibodies to these antigens.

C) The infant receives maternal antibodies via breastmilk, and these antibodies provide the infant with immediate protection against specific antigens.

D) Consumption of breastmilk reduces the need for vaccinations as the mother's immunity is transferred to the infant.

Answer: C

Explanation: A) Breast milk does not stimulate the infant's immune system to produce antibodies.

B) Breast milk does not introduce antigens into the infant or stimulate the immune system to produce antibodies to the antigens.

C) Passive immunity occurs when individuals receive antibodies from another person rather than by producing them through their own immune system. This type of immunity is immediate, and it can be acquired through the passing of antibodies between mother and newborn via breastmilk.

D) Breast milk does not transfer the mother's immunity to the infant.

Page Ref: 514

Learning Outcome: 8.1. Analyze the physiology of immunity in the body.

MNL LO: Analyze the concept of immunity and its application to nursing care.

15) A client is diagnosed with leukopenia. Which condition should the nurse suspect the client is experiencing?
A) Immunocompetence
B) An infection somewhere in the body
C) Suppressed bone marrow activity
D) An abnormally high number of circulating leukocytes
Answer: C
Explanation: A) Low leukocyte levels disrupt the body's ability to adequately respond to infection and may result in immunodeficiency, not immunocompetence.
B) In individuals with proper immune system function, the presence of infection should cause an elevation in circulating leukocytes (leukocytosis) rather than leukopenia.
C) Leukopenia involves a decrease in the number of circulating leukocytes in the body. Because leukocytes are produced in the bone marrow, the presence of leukopenia suggests that an individual may have suppressed bone marrow activity.
D) In individuals with proper immune system function, the presence of infection should cause an elevation in circulating leukocytes (leukocytosis) rather than leukopenia.

MNL LO: Analyze the concept of immunity and its application to nursing care.

Exemplar 8.A HIV and AIDS

1) Once inside the body, human immunodeficiency virus (HIV) infects and destroys several types of cells, including helper T cells. List each of the events in this process in the order in which they occur.
A) Virus recognizes and invades cells that have the CD4 antigen
B) Viral RNA is acted upon by reverse transcriptase
C) Viral DNA integrates with helper T cell DNA
D) Virus disrupts cell membrane of helper T cell, leading to its destruction
E) Virus sheds its protein coat
Answer: A, E, B, C, D
Explanation: The HIV virus first recognizes and invades the cells that have the CD4 antigen. helper T cell. Once inside the cell, the virus sheds its protein coat and uses reverse transcriptase to convert the viral RNA to DNA. This viral DNA is then integrated into the host cell's DNA and duplicated during normal processes of cell division. Finally, the virus buds from the cell surface, disrupting its cell membrane and leading to destruction of the host cell.
Page Ref: 516

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.A.1. Analyze HIV/AIDS as it relates to immunity. Describe the pathophysiology of HIV/AIDS.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

2) A client with acquired immunodeficiency syndrome (AIDS) who is on antiretroviral therapy reports nausea, fever, severe diarrhea, and anorexia. Which prescribed medications does the nurse anticipate in order to relieve the anorexia and stimulate the client's appetite? **Select all that apply.**
A) Dronabinol (Marinol)
B) Zidovudine (Retrovir, AZT)
C) Abacavir (Ziagen)
D) Ciprofloxacin (Cipro)
E) Megestrol (Megace)
Answer: A, E
Explanation: A) Dronabinol (Marinol) can be prescribed to increase client appetite and promote weight gain.
B) Zidovudine (Retrovir, AZT) is an antiretroviral agent.
C) Abacavir (Ziagen) is a potent inhibitor of reverse transcriptase.
D) Ciprofloxacin (Cipro) is an anti-infective medication.
E) Megestrol (Megace) can be prescribed to increase client appetite and promote weight gain.
Page Ref: 528

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.3 Demonstrate clinical judgment founded on a broad knowledge base. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 8.A.4. Analyze HIV/AIDS as it relates to immunity. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with HIV/AIDS.

WW.TBSM.WS

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

3) The nurse is preparing a teaching tool about the human immunodeficiency virus (HIV). Which statement should the nurse delete from the tool?
A) Clients who will require blood transfusions during surgery should encourage their family members to donate the blood they will receive.
B) The only totally safe sex practices are abstinence; long-term, mutually monogamous sexual relations between uninfected individuals; and mutual masturbation without direct contact.
C) When possible, autologous transfusion is a good risk reduction strategy for clients who are undergoing surgery.
D) Clients should use condoms during every sexual encounter involving vaginal, oral, or anal intercourse.
Answer: A
Explanation: A) Autologous blood transfusions are another appropriate prevention strategy for clients who are scheduled for surgery; however, clients should be cautioned against seeking blood donations from family members, as these individuals may be reluctant to disclose whether they have engaged in any high-risk behaviors.
B) Clients can reduce their risk of contracting HIV by remaining abstinent; engaging only in long-term, mutually monogamous sexual relations between uninfected individuals; or engaging in mutual masturbation without direct contact.
C) Autologous blood transfusions are another appropriate prevention strategy for clients who are scheduled for surgery.
D) If clients opt to engage in sexual activity beyond these categories, they should use condoms during every encounter, no matter whether it involves vaginal, oral, or anal intercourse.
Page Ref: 518
Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.A.2. Analyze HIV/AIDS as it relates to immunity. Compare the risk factors and prevention of HIV/AIDS.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

4) The nurse is assessing a client with AIDs. Which is the most commonly observed opportunistic infection for which the nurse should assess this client?

A) Tuberculosis

B) *Pneumocystis jiroveci* pneumonia

C) *Candida albicans* infection

D) *Mycobacterium avium* complex

Answer: B

Explanation: A) Tuberculosis is also an opportunistic infection that frequently affects individuals with AIDS, but it is not as common as *Pneumocystis jiroveci* pneumonia.

B) *Pneumocystis jiroveci* pneumonia is the most common opportunistic infection affecting clients with AIDS and is a common cause of death in these clients.

C) *Candida albicans* infection is an opportunistic infection that frequently affects individuals with AIDS, but it is not as common as *Pneumocystis jiroveci* pneumonia.

D) *Mycobacterium avium* complex is also an opportunistic infection that frequently affects individuals with AIDS, but it is not as common as *Pneumocystis jiroveci* pneumonia.

Page Ref: 520

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 8.A.3. Analyze HIV/AIDS as it relates to immunity. Identify the clinical manifestations of HIV/AIDS.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

5) A client recently diagnosed with human immunodeficiency virus (HIV) states, "I don't plan on giving up sex just because I am HIV positive." Based on this data, which problem is the priority for this client?

A) Risk for Infection
B) Anxiety
C) Compromised sexuality
D) Inadequate coping skills

Answer: C

Explanation: A) The client's intention to continue having sex does not increase the risk for infection.

B) The client's intention to continue having sex does not indicate anxiety.

C) The diagnosis of HIV infection can significantly alter the patient's expressions of sexuality. Discuss safer sex practices, including hugging, cuddling, nonsexual contact, use of latex condoms and spermicidal lubricant, and mutual masturbation. Alternative forms of sexual activity and expressing affection can allow the patient and significant other to remain close.

D) The client's intention to continue having sex does not indicate inadequate coping skills.

Page Ref: 537

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 8.A.5. Analyze HIV/AIDS as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with HIV/AIDS.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

6) The nurse instructs a client with human immunodeficiency virus (HIV) infection on ways to prevent intimate partners from getting the virus. Which statement indicates to the nurse that additional teaching is needed?

A) "I know to use an oil-based lubricant to prevent spread of the virus to my partner."

B) "I can still hug my partner to show affection."

C) "I will not share my razor with my partner."

D) "I know I have to practice safer sex with my partner by using a latex condom."

Answer: A

Explanation: A) The client statement regarding use of an oil-based lubricant indicates the need for further education. Clients should use only water-based lubricants, because oil-based lubricants can result in condom damage.

B) Nonsexual contact is a safe sexual practice.

C) Any device that could transfer blood should not be shared.

D) Latex condoms can prevent the spread of HIV.

Page Ref: 537

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 8.A.5. Analyze HIV/AIDS as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with HIV/AIDS.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

7) The nurse is planning care for a pediatric client with human immunodeficiency virus (HIV). Which interventions will the nurse include to reduce the client's risk for infection? **Select all that apply.**

A) Administering tuberculosis skin tests every 6 months
B) Teaching proper food-handling techniques to the family
C) Instructing on the importance of delaying vaccinations until adulthood
D) Assessing the health status of all visitors
E) Monitoring hand-washing techniques used by the family
Answer: B, D, E
Explanation: A) Tuberculosis skin tests should be administered annually, not every 6 months.
B) Proper food handling will reduce the risk of the client being exposed to a gastrointestinal infection.
C) Pediatric clients with HIV should be immunized as soon as they reach the age recommended for diphtheria, tetanus, and acellular pertussis; inactivated poliovirus; *Haemophilus influenzae* type b; hepatitis B; pneumococcal vaccine; and annual influenza vaccine.
D) It is important to keep individuals who have symptoms of illness away from the child.
E) Handwashing helps prevent the spread and transmission of infections.
Page Ref: 535
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 8.A.6. Analyze HIV/AIDS as it relates to immunity. Differentiate care of patients with HIV/AIDS across the lifespan.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

8) The nurse is reviewing the laboratory results of a client who is newly diagnosed with acquired immunodeficiency syndrome (AIDS). Which result should be reported to the client's healthcare provider?

A) CD4 cell count of 195/mm^3

B) Viral load 6500 copies/mL

C) Negative tuberculin skin test

D) WBC count of 6500/mm^3

Answer: A

Explanation: A) A CD4 cell count of less than 200/mm^3 should be reported to the healthcare provider because it indicates that opportunistic infections and cancer are likely.

B) A viral load of 5000-10,000 copies/mL in a client who is known to have AIDS does not indicate the need for changes in the treatment regimen.

C) A negative tuberculin test is considered normal.

D) A WBC count of 6500/mm^3 is considered normal.

Page Ref: 520

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.1. Learning Outcome: 8.A.4. Analyze HIV/AIDS as it relates to immunity. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with HIV/AIDS.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

9) The home health nurse is visiting several clients who are diagnosed with acquired immunodeficiency syndrome (AIDS). Which client would the nurse see first?

A) A client who is receiving lamivudine (Triumeq) because of a low CD4 cell count

B) A client with *Pneumocystis jiroveci* pneumonia who called the office this morning to report a new onset of fever, cough, and shortness of breath

C) A client with wasting syndrome who needs dietary modifications and education regarding these changes

D) A client who is receiving IV antibiotics daily for toxoplasmosis

Answer: B

Explanation: A) This client is receiving treatment and does not need to be urgently assessed.

B) Based on the ABCs (airway, breathing, and circulation) and the report of new onset of fever and shortness of breath, the nurse should visit the client with *Pneumocystis jiroveci* pneumonia first to obtain vital signs and perform a respiratory assessment.

C) The client with wasting syndrome can receive teaching at any time.

D) The client is receiving treatment and can be assessed later.

Page Ref: 520

Cognitive Level: Analyzing

Client Need/Sub: Safe and Effective Care Environment: Management of Care

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 8.A.5. Analyze HIV/AIDS as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with HIV/AIDS.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

10) A pregnant client with HIV is concerned about how the diagnosis might affect the health of the child. Which statement should the nurse include when teaching the client?

A) "One way to reduce the risk of transmitting the virus to your child is to opt for vaginal birth rather than cesarean delivery."

B) "Although infants can acquire HIV from their mothers at birth, the virus cannot cross the placenta during pregnancy."

C) "Most HIV medications are safe during pregnancy and taking them can reduce the risk of transmitting the virus to the fetus."

D) "Women with HIV are no more likely than uninfected women to experience miscarriage or fetal loss."

Answer: C

Explanation: A) Cesarean delivery carries a lower risk of transmission than vaginal delivery.

B) Virus transmission is possible both across the placenta and at birth.

C) Women with HIV should be advised that most HIV medications are safe during pregnancy and taking them can reduce the risk of maternal-fetal transmission.

D) Pregnant clients with HIV should be educated about the increased risk of fetal loss and neonatal mortality associated with their diagnosis.

Learning Outcome: 8.A.6. Analyze HIV/AIDS as it relates to immunity. Differentiate care of patients with HIV/AIDS across the lifespan.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

11) The nurse is caring for a client with acquired immunodeficiency syndrome (AIDS). Which type of precaution should the nurse implement for this client?
A) Droplet
B) Reverse
C) Standard
D) Contact
Answer: C
Explanation: A) Droplet precautions are not required.
B) Reverse precautions are not required.
C) Healthcare workers can prevent most exposures to HIV by using standard precautions. With standard precautions, healthcare workers treat all high-risk body fluids as if they are infectious, and use barrier precautions to prevent skin, mucous membrane, or percutaneous exposure to these fluids.
D) Contact precautions are not required.
Page Ref: 518
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control

Learning Outcome: 8.A.2. Analyze HIV/AIDS as it relates to immunity. Compare the risk factors and prevention of HIV/AIDS.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

12) A pediatric client with human immunodeficiency virus (HIV) is severely symptomatic with the additional diagnoses of lymphoma and wasting syndrome. Which clinical stage of HIV does the nurse anticipate for this client?
A) Category N
B) Category C
C) Category A
D) Category B
Answer: B
Explanation: A) Category N is non-symptomatic.
B) The client described is Category C, a severely symptomatic client with lymphoma and wasting syndrome.
C) Category A is mildly symptomatic.
D) Category B is moderately symptomatic.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with HIV and AIDS.

Exemplar 8.B Hypersensitivity

1) A pediatric client is receiving an infusion of intravenous antibiotic at the ambulatory clinic. Which clinical manifestation indicates that the client is experiencing a type I hypersensitivity reaction?
A) Erythema
B) Fever
C) Joint pain
D) Hypotension
Answer: D
Explanation: A) Erythema is associated with type IV hypersensitivity reaction.
B) Fever is associated with type III hypersensitivity reaction.
C) Joint pain is associated with type III hypersensitivity reaction.
D) Clinical manifestations associated with a type I hypersensitivity reaction include hypotension, wheezing, gastrointestinal or uterine spasm, stridor, and urticaria.
Page Ref: 541
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.B.3. Analyze hypersensitivity as it relates to immunity. Identify the clinical manifestations of hypersensitivity.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

2) The nurse is assessing a client who is receiving IV antibiotics. Which item in the client's health history increases the risk for experiencing a hypersensitivity reaction?
A) 26 years of age
B) Caucasian race
C) Previous antibiotic therapy
D) Concurrent chronic illness
Answer: C
Explanation: A) Anyone can have a hypersensitivity reaction. However, older age increases the risk.
B) Race is not a risk factor for a hypersensitivity reaction.
C) Anyone can have a hypersensitivity reaction. However, risk generally increases with previous exposure, because antigens must be formed with the first exposure before hypersensitivity is likely to occur.
D) Concurrent chronic illness is not identified as a risk factor for a hypersensitivity reaction.
Page Ref: 545
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.B.2. Analyze hypersensitivity as it relates to immunity. Compare the risk factors and prevention of hypersensitivity.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

3) A pediatric client has a ventriculoperitoneal (VP) shunt placed at birth after a meningocele repair. Which product should the nurse avoid when providing care to this client?
A) Synthetic rubber gloves
B) Polyethylene gloves
C) Non-powdered nitrile gloves
D) Latex gloves
Answer: D
Explanation: A) Synthetic rubber gloves would be safe to use with this client.
B) Polyethylene gloves would be safe to use with this client.
C) Non-powdered nitrile gloves would be safe to use with this client.
D) Meningocele is a form of spina bifida, and clients with a history of spina bifida are at increased risk for latex allergy.
Page Ref: 544
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.B.2. Analyze hypersensitivity as it relates to immunity. Compare the risk factors and prevention of hypersensitivity.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

4) The nurse identifies that a client with allergies is at risk for shock. Which information caused the nurse to identify this problem?
A) Anaphylactic reaction to shellfish
B) A drug reaction to penicillin causing a rash
C) Glomerulonephritis
D) Dermatitis resulting from a response to laundry detergent
Answer: A
Explanation: A) Type I hypersensitivities, such as anaphylactic reactions, occur immediately and may be life-threatening. Because the client has a history of this type of reaction, a risk for shock is a potential problem.
B) A drug reaction to penicillin that causes a rash does not increase the client's risk for shock.
C) A history of glomerulonephritis does not increase the client's risk for shock.
D) Dermatitis from a laundry detergent does not increase the client's risk for shock.
Page Ref: 559
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Diagnosis
Learning Outcome: 8.B.2. Analyze hypersensitivity as it relates to immunity. Compare the risk factors and prevention of hypersensitivity.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

5) The nurse is preparing to assess a client when one of the client's family members begins showing symptoms of latex sensitivity. Which action by the nurse is the most appropriate?
A) Ask the family member to leave the unit.
B) Transfer the client to a department that does not use latex products.
C) Wait until Monday to report the problem to the unit supervisor.
D) Obtain latex-free products for the client's room.
Answer: D
Explanation: A) Asking the family member to leave would be a violation of the client's rights.
B) Transferring the client to a department that does not use latex products is unrealistic because the family member might experience exposure on another unit. (No hospital unit can be completely latex-free.)
C) Waiting until Monday does not solve the problem.
D) When symptoms of sensitivity to latex occur on exposure, latex-free products should be supplied.
Page Ref: 546
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.B.2. Analyze hypersensitivity as it relates to immunity. Compare the risk factors and prevention of hypersensitivity.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

6) A client is experiencing anaphylactic shock following the administration of a medication. In which position should the nurse place the client?
A) Trendelenburg position
B) Flat, with legs slightly elevated
C) Supine position
D) High-Fowler position
Answer: D
Explanation: A) The Trendelenburg position elevates the foot of the bed and is no longer recommended for the treatment of shock, as it causes the abdominal organs to press against the diaphragm, which impedes respirations and decreases coronary artery filling.
B) Lying flat is not recommended.
C) A person in a supine position may not be able to maintain an open airway.
D) Placing the client in Fowler or high-Fowler position allows optimal lung expansion and ease of breathing.
Page Ref: 558
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.B.5. Analyze hypersensitivity as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with hypersensitivity.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

7) A client with a history of latex allergies develops audible wheezing, pruritus, urticaria, and signs of angioedema. Which action should the nurse take?
A) Teach the client regarding use of a kit that contains treatment for allergic reactions.
B) Administer diphenhydramine (Benadryl) by mouth every 4 hours per the healthcare provider's orders.
C) Administer epinephrine 1:1000 by subcutaneous injection per the healthcare provider's orders.
D) Collect a detailed history from the client regarding the history of latex allergies.
Answer: C
Explanation: A) Although providing client teaching is important, the nurse does not have time to do these things until the client's immediate and potentially dangerous physical symptoms are addressed.
B) Diphenhydramine may also be given, but it would likely be administered by injection rather than mouth due to the need for rapid drug onset.
C) For reactions with wheezing, pruritus, urticaria, and angioedema, a subcutaneous injection of 0.3-0.5 mL of 1:1000 epinephrine is generally sufficient. The nurse should give the epinephrine first due to the nature and severity of symptoms.
D) Although collecting a detailed history is important, the nurse does not have time to do these things until the client's immediate and potentially dangerous physical symptoms are addressed.
Page Ref: 551
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.B.4. Analyze hypersensitivity as it relates to immunity. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with hypersensitivity.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

8) The nurse at a summer camp learns that a child received several bee stings. Which clinical manifestations would necessitate injecting the child with epinephrine (EpiPen)? **Select all that apply.**
A) Skin that is cold and clammy to the touch
B) Skin that is warm and dry to the touch
C) Hyperverbal behavior
D) Extreme anxiety and agitation
E) Facial swelling
Answer: A, D, E
Explanation: A) General symptoms of shock that would necessitate an epinephrine injection include cold and clammy skin (which is indicative of decreased perfusion).
B) Warm and dry skin is not a clinical manifestation of shock.
C) Clients who are experiencing shock are unlikely to be hyperverbal due to respiratory symptoms that make breathing and speaking difficult.
D) General symptoms of shock that would necessitate an epinephrine injection include extreme anxiety and agitation.
E) General symptoms of shock that would necessitate an epinephrine injection include facial angioedema.
Page Ref: 559
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.B.6. Analyze hypersensitivity as it relates to immunity. Differentiate care of patients with hypersensitivity across the lifespan.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

9) The nurse is preparing a teaching tool about food allergies. Which statement does the nurse include in this tool?

A) Over the past decade, the prevalence of peanut allergy has decreased in the pediatric population.

B) Many children eventually outgrow egg, milk, and soy allergies.

C) Teenagers with food allergies are at lower risk for an allergic reaction than younger clients because they are more aware of their trigger foods and how to avoid them.

D) Peanut allergies are most common in pediatric clients over 5 years of age.

Answer: B

Explanation: A) Among pediatric clients, the prevalence of peanut allergy has increased in recent years, with children under age 3 most commonly affected.

B) It is not uncommon for people to outgrow allergies to egg, milk, soy, and wheat as they age.

C) Teenagers with food allergies have the highest risk for an allergic reaction because they have a greater tendency to eat meals outside the home and are less likely to carry their medication.

D) Among pediatric clients, the prevalence of peanut allergy has increased in recent years, with children under age 3 most commonly affected.

Page Ref: 557

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 8.B.6. Analyze hypersensitivity as it relates to immunity. Differentiate care of patients with hypersensitivity across the lifespan.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

10) A pediatric client with a history of anaphylactic hypersensitivity reactions will be discharged with a prescription for an EpiPen. Which statements should the nurse include in the discharge instructions for this client and family? **Select all that apply.**
A) "It is recommended that the child wear a medical alert bracelet."
B) "This medication does not come prefilled and must be measured."
C) "Keep the medication in the car at all times."
D) "Frequently check the expiration date of the medication."
E) "Keep the medication in one location that is easy to remember."
Answer: A, D
Explanation: A) The nurse should recommend that the client wear a medical alert bracelet.
B) An EpiPen is a prefilled syringe-and-needle medication system used to treat an anaphylactic reaction.
C) The medication should not be kept in the car at all times, as it needs to be stored away from high heat and direct sunlight.
D) The EpiPens' expiration dates should be checked frequently to ensure accurate strength.
E) The client should have multiple EpiPens and they should be kept in multiple areas, not one location.
Page Ref: 557, 558
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 8.B.6. Analyze hypersensitivity as it relates to immunity. Differentiate care of patients with hypersensitivity across the lifespan.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

11) A nurse is caring for a client with seasonal hypersensitivity reactions. What teachings should the nurse provide to improve this client's comfort? **Select all that apply.**
A) Keep doors and windows open on high-allergen days to circulate air.
B) Remain indoors, if possible, on high-allergen days.
C) Maintain a clean, dust-free environment.
D) Take antihistamine and leukotriene medications as ordered.
E) Stop taking oral corticosteroids immediately once symptoms disappear.
Answer: B, C
Explanation: A) The doors and windows should be kept closed on high-allergen days.
B) A client with seasonal hypersensitivity should be educated regarding prevention and comfort measures. The nurse should instruct the client to keep doors and windows closed on high-allergen days and to remain indoors if possible.
C) The nurse should include teaching on maintaining a clean, dust-free environment.
D) Medication instruction should include information about taking antihistamine and antileukotriene medications, not leukotriene medications.
E) The client should also be instructed to taper oral corticosteroids as ordered, not to immediately stop taking them.
Page Ref: 546
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 8.B.4. Analyze hypersensitivity as it relates to immunity. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with hypersensitivity.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

12) The nurse suspects that the client is experiencing a reaction to a specific antigen. Which laboratory result supports the conclusion made by the nurse?
A) Indirect Coombs test showing no agglutination
B) Patch test with a 1-inch area of erythema
C) 2% eosinophils in the WBC count
D) Rh antigen test with negative results
Answer: B
Explanation: A) An indirect Coombs test detects the presence of circulating antibodies against RBCs; no agglutination is considered a normal finding.
B) An area of erythema after a patch test indicates a positive response to a specific antigen.
C) An eosinophil count of 2% is within the normal range.
D) An Rh antigen test with a negative result indicates that the client does not carry the antigen.
Page Ref: 550
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.B.4. Analyze hypersensitivity as it relates to immunity. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with hypersensitivity.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

13) The nurse is asked to explain the difference between type IV hypersensitivity reactions and the other types of hypersensitivity reactions. Which response will the nurse make?
A) Unlike other types of hypersensitivity reactions, type IV reactions are antibody-mediated responses and develop almost immediately.
B) Unlike other types of hypersensitivity reactions, type IV reactions are cell-mediated responses and develop almost immediately.
C) Unlike other types of hypersensitivity reactions, type IV reactions are antibody-mediated responses and take 24 hours or more to develop.
D) Unlike other types of hypersensitivity reactions, type IV reactions are cell-mediated responses and take 24 hours or more to develop.
Answer: D
Explanation: A) Type IV are cell-mediated immune responses.
B) Type IV reactions are delayed rather than immediate.
C) Type IV reactions are cell-mediated immune responses.
D) Type IV are cell-mediated immune responses and develop 24-48 hours after exposure to an antigen.
Page Ref: 543
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.B.1. Analyze hypersensitivity as it relates to immunity. Describe the pathophysiology of hypersensitivity.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with hypersensitivity.

14) A client with allergies asks why a newer medication was prescribed. Which information will the nurse include to explain why second-generation antihistamines are often preferred in the treatment of hypersensitivity reactions?
A) Second-generation antihistamines are faster acting than first-generation antihistamines.
B) Second-generation antihistamines are less likely than first-generation antihistamines to cause drowsiness.
C) Second-generation antihistamines are available over the counter, whereas first-generation antihistamines require a prescription.
D) Second-generation antihistamines can be administered either orally or parenterally, whereas first-generation antihistamines can only be given via the oral route.
Answer: B
Explanation: A) Second-generation antihistamines are not universally faster-acting than their first-generation counterparts.
B) An important difference between first- and second-generation antihistamines is that unlike the first-generation drugs, the newer second-generation drugs do not cause drowsiness.
C) Both first- and second-generation antihistamines are available by prescription and over the counter.
D) The preferred route of administration for both first- and second-generation antihistamines is oral, although diphenhydramine (a first-generation drug) and some other medications may be given parenterally.
Page Ref: 550
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Exemplar 8.C Rheumatoid Arthritis

1) The nurse is preparing a teaching tool about rheumatoid arthritis (RA). Which potential complication will the nurse delete from the tool?
A) Risk of cesarean delivery
B) Risk of pleural effusion
C) Likelihood of uveitis
D) Risk of anemia
Answer: A
Explanation: A) Pregnant women with RA are no more likely to undergo cesarean delivery than pregnant women without RA.
B) All individuals with RA are at increased risk of plural effusion.
C) All individuals with RA are at increased risk of uveitis.
D) Individuals with RA are at risk for anemia of chronic inflammation because of the inability of the bone marrow to incorporate stored iron to produce enough healthy RBCs.
Page Ref: 565
Cognitive Level: Understanding

W W . T E S T . W S
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

2) A client recently diagnosed with rheumatoid arthritis (RA) asks if RA always causes crippling deformities. What information should the nurse include when teaching ways to decrease the likelihood of crippling deformities? **Select all that apply.**
A) Ignore pain as a warning signal.
B) Type instead of hand-writing items if possible.
C) Use the strongest joints possible to complete most tasks.
D) Avoid stress to any current area of deformity.
E) Stop an activity immediately if it is beyond your ability to perform.
Answer: B, C, D, E
Explanation: A) Pain is a warning signal, so the client with RA should immediately stop any activity that causes pain.
B) The client with RA should never attempt to push a joint beyond its ability. Pain is a warning signal, so the client with RA should immediately stop any activity that causes pain. The client should avoid activities (like writing) that require a strong grip.
C) The client should use the strongest joints possible to complete tasks.
D) When performing tasks, the client should avoid stress in any current area of deformity to help prevent further deformities.
E) The client with RA should immediately stop any activity that causes pain.
Page Ref: 572
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.C.3. Analyze rheumatoid arthritis as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with rheumatoid arthritis.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

3) The nurse is preparing material about rheumatoid arthritis (RA) for a health fair. Which type of client will the nurse identify as most likely to be diagnosed with this condition?
A) A 31-year-old man
B) A 42-year-old woman
C) A 65-year-old woman
D) An 18-year-old man
Answer: B
Explanation: A) RA affects three times as many women as men.
B) The typical age of onset is between 30 and 50 years.
C) It is more likely to affect women between the ages of 30 and 50 years.
D) RA is more likely to affect women between the ages of 30 and 50 years.
Page Ref: 561
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 8.C.3. Analyze rheumatoid arthritis as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with rheumatoid arthritis.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

4) The nurse is planning care for a client with rheumatoid arthritis. For which client statement should the nurse plan care for the problem of fatigue?
A) "I seem to get tired early in the day and require a nap."
B) "My joints are stiffest at night before I go to sleep."
C) "I find it difficult to move after sitting too long."
D) "I take ibuprofen for the pain as needed."
Answer: A
Explanation: A) One hallmark symptom of RA is extreme fatigue. The client's statement regarding the need for a nap supports the problem of fatigue.
B) The problem of compromised physical mobility would be appropriate for the client experiencing stiff joints before going to sleep.
C) The problem of compromised physical mobility would be appropriate for the client experiencing difficulty moving after sitting too long.
D) The problem of chronic pain would be appropriate for the client taking ibuprofen for pain as needed.
Page Ref: 572
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Learning Outcome: 8.C.3. Analyze rheumatoid arthritis as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with rheumatoid arthritis.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

5) A client with rheumatoid arthritis (RA) asks for suggestions regarding exercise. Which recommendation should the nurse make?
A) Swimming
B) Jogging
C) Tennis
D) Bowling
Answer: A
Explanation: A) Swimming exercises all the extremities without putting undue stress on joints.
B) Jogging would cause joint discomfort.
C) Tennis could cause joint discomfort.
D) Bowling could cause joint discomfort.
Page Ref: 569
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.8 Promote self-care management. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 8.C.4. Analyze rheumatoid arthritis as it relates to immunity. Differentiate care of patients with rheumatoid arthritis across the lifespan.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

6) A client with rheumatoid arthritis (RA) is being seen in the outpatient clinic for a progress checkup. Which statement indicates to the nurse that the client has met a goal of treatment?
A) "I sleep for 10 hours at night."
B) "I have increased pain in my joints all the time now."
C) "I have delegated many household chores to my children and spouse."
D) "I do not perform household chores at all anymore."
Answer: C
Explanation: A) Sleeping for 10 hours at night will not alleviate the need for frequent rest periods during the day.
B) Increased joint pain would indicate that goals have not been met.
C) One technique for reducing stress on the joints is to delegate household tasks to family members.
D) The client does not need to refrain from all household chores.
Page Ref: 574
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 8.C.3. Analyze rheumatoid arthritis as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with rheumatoid arthritis.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

7) A client with rheumatoid arthritis (RA) is prescribed hydroxychloroquine. Which teaching will the nurse provide about this medication?
A) Limit your intake of high-fat foods
B) Schedule an eye examination every 6 months
C) Stop taking this medication if symptoms improve
D) Take measures to prevent contracting an infection
Answer: B
Explanation: A) There is no reason for the client to limit the intake of high-fat foods.
B) The antimalarial drug hydroxychloroquine (Plaquenil) inhibits the movement of neutrophils and eosinophils and impairs antigen—antibody reactions. Although this drug has a relatively low toxicity, it can cause pigmentary retinitis and vision loss; clients receiving this drug require a vision examination every 6 months.
C) The client should be instructed to take the medication as prescribed.
D) Hydroxychloroquine does not cause immunosuppression.
Page Ref: 569
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Learning Outcome: 8.C.2. Analyze rheumatoid arthritis as it relates to immunity. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with rheumatoid arthritis.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

8) A client with rheumatoid arthritis (RA) reports a pain level of 3 on a scale from 0 to 10. Which nonpharmacologic interventions will the nurse suggest to enhance the client's comfort? **Select all that apply.**
A) Discourage any position changes.
B) Encourage relaxation techniques.
C) Splint the extremity.
D) Offer heat and/or cold packs.
E) Provide distraction activities.
Answer: B, C, D, E
Explanation: A) Position changes are encouraged along with supportive equipment.
B) Nonpharmacologic activities for pain relief include relaxation.
C) Splints provide joint rest and prevent contractures.
D) Nonpharmacologic activities for pain relief include the application of heat and cold.
E) Nonpharmacologic activities for pain relief include distraction.
Page Ref: 569-570
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.B.7. Initiate effective treatments to relieve pain and suffering in light of patient values, preferences and expressed needs. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.C.3. Analyze rheumatoid arthritis as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with rheumatoid arthritis.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

9) A client with rheumatoid arthritis (RA) is in the 3rd trimester of pregnancy. For which potential issue should the nurse plan care because the client is taking an aspirin a day?
A) Higher risk for preterm delivery
B) Increased need for medication
C) Acute exacerbation of symptoms
D) Continued risk for anemia
Answer: D
Explanation: A) Many pregnant clients with RA have prolonged gestations.
B) Due to remission, a decrease in medication is often necessitated.
C) Many pregnant clients with RA often experience a remission during pregnancy and relapse after delivery.
D) If salicylate therapy is continued, anemia may be present during the postpartum period as a result of blood loss.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 8.C.4. Analyze rheumatoid arthritis as it relates to immunity. Differentiate care of patients with rheumatoid arthritis across the lifespan.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

10) A client with rheumatoid arthritis (RA) asks how it differs from osteoarthritis (OA). Which responses will the nurse make? **Select all that apply.**

A) "The onset of RA is gradual, whereas the onset of OA may be rapid."

B) "With OA, multiple joints are symmetrically affected; RA affects one joint at a time."

C) "The affected joints in RA feel cold to the touch, whereas the affected joints in OA are warm or hot to the touch."

D) "OA is slowly progressive, whereas RA is characterized by exacerbations and remissions."

E) "With RA, pain and stiffness occur with activity; with OA, pain and stiffness are predominant upon arising."

Answer: A, D, E

Explanation: A) The onset of both RA and OA are gradual.

B) RA affects multiple joints symmetrically, but OA affects one joint at a time.

C) The affected joints in OA feel cold to the touch, whereas the affected joints in RA are warm or hot to the touch.

D) OA is slowly progressive, whereas RA has exacerbations and remissions.

E) With RA, pain and stiffness occur with activity; with OA, pain and stiffness are predominant upon arising.

Learning Outcome: 8.C.1. Analyze rheumatoid arthritis as it relates to immunity. Identify the clinical manifestations of rheumatoid arthritis.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

11) A client with rheumatoid arthritis (RA) is prescribed nonsteroidal anti-inflammatory drugs (NSAIDs). Which actions will the nurse take when caring for this client? **Select all that apply.**
A) Monitoring for signs of allergic reaction
B) Assuring the client that NSAIDs are safe for clients with cardiovascular disease
C) Encouraging the client to take NSAIDs with a small snack to help avoid GI distress
D) Monitoring for signs of renal problems
E) Inquire about the use of herbal supplements such as feverfew, garlic, ginger, or ginkgo
Answer: A, C, D, E
Explanation: A) When providing care to a client who is receiving any medication, it is important to monitor for signs of allergic reaction.
B) Because NSAIDs can cause blood pressure alterations, they may be dangerous for clients with cardiovascular disorders.
C) Taking NSAIDs with food may help reduce symptoms of GI distress that are often associated with these drugs.
D) Clients who are on NSAIDs should be monitored for signs of renal problems, because these medications are potentially nephrotoxic.
E) Clients should also avoid herbal supplements such as feverfew, garlic, ginger, and gingko, as these substances can increase the risk of bleeding associated with NSAID use.

WwW.TeSt.Ws

12) A school-age client has arthritis that affects the knees, ankles, and elbows. For which type of juvenile idiopathic arthritis (JIA) will the nurse plan care for this client?
A) Pauciarticular
B) Polyarticular
C) Systemic
D) Osteoarthritis
Answer: A
Explanation: A) Pauciarticular arthritis primarily affects the knees, ankles, and elbows.
B) Polyarticular arthritis affects many joints (five or more), particularly the small joints of the hands and fingers. It also may affect the hips, knees, feet, ankles, and neck.
C) Systemic arthritis involves high fever, polyarthritis, and rheumatoid rash, and it also affects internal organs.
D) Osteoarthritis is a separate condition, not a form of JIA.
Page Ref: 570
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 8.C.4. Analyze rheumatoid arthritis as it relates to immunity. Differentiate care of patients with rheumatoid arthritis across the lifespan.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with rheumatoid arthritis.

13) A client with rheumatoid arthritis (RA) asks why a medication for stomach acid was prescribed. Which response will the nurse make?
A) Proton pump inhibitors help reduce the unpleasant GI-related side effects of NSAIDs, which are the most common class of medications used in the treatment of RA.
B) Proton pump inhibitors can dramatically decrease both inflammation and immune reactions and appear to slow the progression of joint destruction in RA.
C) Proton pump inhibitors help reduce the body's autoimmune response, thereby limiting the effects of the autoimmune disease process that underlies RA.
D) Proton pump inhibitors help reduce the risk of retinitis and vision loss in clients who are taking antimalarial agents as part of their therapeutic regimen for RA.
Answer: A
Explanation: A) NSAIDs are among the most common dugs used in the treatment of RA, although they may produce unpleasant gastric side effects like stomach lining irritation, erosions, and bleeding ulcers. Concurrent administration of proton pump inhibitors may reduce the risk for GI bleeding due to NSAIDs.
B) Proton pump inhibitors do not affect the inflammation, immune reactions, and joint destruction associated with RA.
C) Proton pump inhibitors do not reduce the body's autoimmune response.
D) Proton pump inhibitors do not affect the risk of vision problems that accompanies use of antimalarial agents.
Page Ref: 568

Exemplar 8.D Systemic Lupus Erythematosus

1) A client reports feeling tired and has a change in appetite during a health interview. Which condition should the nurse suspect when a butterfly rash is assessed over the client's nose and cheeks?
A) Systemic lupus erythematosus
B) Fibromyalgia
C) Lyme disease
D) Gout
Answer: A
Explanation: A) A "butterfly rash" that covers the bridge of the nose and the cheeks is a characteristic manifestation of systemic lupus erythematosus (SLE).
B) Although fibromyalgia has some of the symptoms of SLE (e.g., joint pain and/or fatigue), it does not cause a rash over the nose and cheeks.
C) Lyme disease is not associated with a butterfly rash over the nose and cheeks.
D) Gout does not cause a butterfly rash over the nose and cheeks.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.D.3. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Identify the clinical manifestations of SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

WWW.TPSM.US

2) A client asks if there are any conditions that can exacerbate systemic lupus erythematosus (SLE). Which response should the nurse make?
A) "Conditions that cause hypotension often worsen SLE."
B) "GI upset is often associated with SLE exacerbation."
C) "Pregnancy is often associated with a worsening of SLE."
D) "Fever is a known trigger for SLE exacerbation."
Answer: C
Explanation: A) Hypotension does not exacerbate SLE.
B) GI upset does not exacerbate SLE.
C) Pregnancy is not contraindicated for most women with SLE. However, the pregnant client requires close monitoring because acute episodes sometimes accompany pregnancy.
D) Fever does not exacerbate SLE.
Page Ref: 585
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.D.6. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Differentiate care of patients with SLE across the lifespan.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

3) The nurse is planning information about systemic lupus erythematosus for a community fair. For which population is this information most applicable?
A) Young female children
B) Young black males
C) Older white women
D) Females of Asian descent
Answer: D
Explanation: A) SLE most often affects women of childbearing age.
B) SLE is more common among women than men.
C) SLE most often affects women of childbearing age.
D) SLE is more common in young women of Asian descent.
Page Ref: 577
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 8.D.2. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Compare the risk factors and prevention of SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

4) A client with systemic lupus erythematosus has an elevated white blood cell count. For which problem should the nurse plan care for this client?
A) Pain
B) Anxiety
C) Infection
D) Skin breakdown
Answer: C
Explanation: A) Pain does not cause the WBC count to be elevated.
B) An elevated WBC count does not cause anxiety.
C) An elevated WBC count occurs when an infection is present. The nurse should implement infection control measures.
D) An elevated WBC count does not cause skin breakdown.
Page Ref: 583
Cognitive Level: Understanding
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 8.D.5. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with SLE.

MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

5) A client with systemic lupus erythematosus (SLE) is prescribed immunosuppressant drugs and corticosteroids. Which information will the nurse include when teaching the client about these medications? **Select all that apply.**
A) Avoid large crowds.
B) Do not get a flu shot.
C) Use contraception to prevent pregnancy.
D) Refrain from taking aspirin products.
E) Report any signs of infection to the healthcare provider.
Answer: A, C, D, E
Explanation: A) Crowds may increase exposure to infection, which is potentially dangerous for clients who are taking immunosuppressants.
B) Annual influenza vaccination is recommended, although clients with significant immunosuppression should not receive live vaccines.
C) Immunosuppressive drugs may increase the risk of birth defects, so contraception is important.
D) Aspirin products may increase the risk of bleeding, which would further impair immune function.
E) Chills, fever, sore throat, fatigue, or malaise should be reported so related infections can be treated as quickly as possible.

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 8.D.4. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

WwW.TeSt.Ws

6) A client with systemic lupus erythematosus (SLE) is concerned about scarring from skin lesions. Which teaching should the nurse provide to minimize the risk of skin infections associated with SLE? **Select all that apply.**
A) Use sunscreen with an SPF of 15 or greater.
B) Remain indoors on sunny days.
C) Avoid swimming in a pool or the ocean.
D) Avoid sun exposure between 10:00 a.m. and 3:00 p.m.
E) Use fluorescent lighting indoors.
Answer: A, D
Explanation: A) Because there is a relationship between sun exposure and infection, the client should be instructed to use sunscreen with an SPF of at least 15.
B) The client does not need to stay indoors on sunny days as long as precautions are taken.
C) The client may swim but should reapply sunscreen after swimming.
D) The client should be instructed to avoid the sun between 10:00 a.m. and 3:00 p.m.
E) When indoors, the client should try to avoid fluorescent lighting, as exacerbations of SLE have been reported following exposure.
Page Ref: 584

Learning Outcome: 8.D.5. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

WwW.TpSM.Us

7) The nurse is discussing care needs with a client with systemic lupus erythematosus (SLE). Which goal should the nurse recommend to the client?
A) Learn strategies to cope with death and the dying process.
B) Remain compliant with a sun protection plan.
C) Gain weight to within 10 pounds of normal for height.
D) Report pain no higher than 4 on a scale of 0 to 10.
Answer: B
Explanation: A) SLE is not fatal.
B) Clients with SLE must protect their skin against the sun to avoid exacerbations.
C) SLE does not affect body weight.
D) SLE is not painful.
Page Ref: 586
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 8.D.5. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

8) The nurse is planning care for an adolescent client with systemic lupus erythematosus (SLE). Which action indicates to the nurse that the client has implemented the plan of care?
A) Refusing to attend school
B) Refraining from attending social functions
C) Discussing skin changes with the healthcare provider
D) Discussing skin changes with a good friend
Answer: D
Explanation: A) Refusing to go to school indicates nonacceptance of the changes to body image.
B) Refusing to attend social functions indicates nonacceptance of the changes to body image.
C) Discussing changes only with healthcare personnel does not indicate the teen has adjusted to the body image changes.
D) Peer interaction is important to teens. Being able to discuss the physical changes related to SLE with a friend indicates acceptance of the change in body image.
Page Ref: 82
Cognitive Level: Analyzing
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 8.D.6. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Differentiate care of patients with SLE across the lifespan.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

WWW.TPSM.US

9) A newly married female client is diagnosed with systemic lupus erythematosus (SLE). Which statement indicates to the nurse that the client understands the treatment plan?
A) "I will take birth control pills while I am taking cytotoxic medications."
B) "I do not need to contact the doctor if I develop a fever or rash."
C) "I plan to go to a concert this weekend so that I get out of the house."
D) "I can take aspirin as indicated for pain."
Answer: A
Explanation: A) Treatment for SLE may include cytotoxic drugs. Because these drugs can cause birth defects, women who take them should be advised to avoid pregnancy by using contraceptives.
B) Clients with SLE should contact their primary care provider whenever signs of infection occur, because it means their immune system is compromised.
C) Clients with SLE should also be taught to avoid crowds, because they are potential sources of infection.
D) Aspirin can cause bleeding, so it should be taken only with extreme care.
Page Ref: 585
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 8.D.5. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Apply the nursing process in providing culturally competent care to an individual with SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

10) A client with systemic lupus erythematosus (SLE) takes hydroxychloroquine (Plaquenil) as prescribed. For which adverse effect should the nurse monitor this client?
A) Pulmonary fibrosis
B) Cushingoid effects
C) Retinal toxicity
D) Renal toxicity
Answer: C
Explanation: A) Pulmonary fibrosis is a potential adverse effect of cyclophosphamide.
B) Cushingoid effects are a concern with corticosteroid therapy.
C) Hydroxychloroquine (Plaquenil) is an antimalarial drug that is also used to reduce the frequency of acute episodes of SLE. The primary concern with Plaquenil is retinal toxicity and possible irreversible blindness.
D) Renal toxicity is not the primary concern with Plaquenil.
Page Ref: 581
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.D.4. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

11) A client with systemic lupus erythematosus (SLE) is prescribed immunosuppressive therapy. Which statements should the nurse include when teaching the client about this treatment? **Select all that apply.**

A) "Avoid large crowds and situations that increase your exposure to infection."
B) "Report any cough or difficulty breathing to the physician if you are taking cyclophosphamide."
C) "Use aspirin instead of acetaminophen if you develop a fever."
D) "Heavy menstrual bleeding may occur during therapy."
E) "Be sure to drink plenty of liquids."

Answer: A, B, E

Explanation: A) Clients who are on immunosuppressant therapy for SLE should be advised to avoid large crowds and situations that increase their exposure to infection.
B) Clients who are on immunosuppressant therapy for SLE should be advised to report difficulty breathing or a cough.
C) Aspirin should not be used, as this may increase the risk for bleeding.
D) Women may have an absence of menstruation, not heavy bleeding, during therapy.
E) Clients who are on immunosuppressant therapy for SLE should be advised to maintain adequate oral hydration.

12) The nurse is assessing a client with systemic lupus erythematosus (SLE). Which manifestation will the nurse least likely assess in this client?
A) Symmetric polyarthritis
B) Excess hair growth
C) Thrombocytopenia
D) Pleural effusions
Answer: B
Explanation: A) Common manifestations of SLE include symmetric polyarthritis.
B) Alopecia (hair loss) is also associated with SLE; excess hair growth is not.
C) Common manifestations of SLE include thrombocytopenia.
D) Common manifestations of SLE include pleural effusions.
Page Ref: 577
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 8.D.3. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Identify the clinical manifestations of SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

13) A client with systemic lupus erythematosus (SLE) is scheduled for renal function testing. For which reason is kidney damage often observed in clients with systemic lupus erythematosus (SLE)?
A) SLE involves unusually high levels of circulating antigens. Because the kidneys play a critical role in filtering these antigens from the blood, they are under excess stress in clients with SLE.
B) SLE is commonly treated with nonsteroidal anti-inflammatory drugs (NSAIDs). Because these medications carry a high risk of nephrotoxicity, their use often leads to kidney damage in clients with SLE.
C) SLE involves deposition of immune complexes in the body's connective tissues. Because connective tissue makes up a significant portion of the kidneys, these organs are a frequent site of damage in SLE.
D) SLE involves unusually high levels of circulating antibodies. Because the kidneys play a critical role in filtering these antibodies from the blood, they are under excess stress in clients with SLE.
Answer: C
Explanation: A) The kidneys do not filter antigens from the blood.
B) Even though NSAIDs are commonly used in the treatment of SLE and may exert nephrotoxic effects, use of NSAIDs is not the primary reason why kidney damage is often observed in clients with SLE.
C) SLE involves deposition of antigen-antibody complexes, also known as immune complexes, in the body's connective tissues. Because connective tissue makes up a large portion of the kidneys, these organs are frequently damaged in SLE.
D) The kidneys do not filter antibodies from the blood. Also, even though NSAIDs are commonly used in the treatment of SLE and may exert nephrotoxic effects, use of NSAIDs is not the primary reason why kidney damage is often observed in clients with SLE.

Learning Outcome: 8.D.3. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Identify the clinical manifestations of SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

14) The nurse is caring for a client with systemic lupus erythematosus (SLE). Which hormonal change would the nurse expect to result in an exacerbation of the condition?
A) Increase in testosterone levels
B) Increase in estrogen levels
C) Increase in overall androgen levels
D) Increase in serotonin levels
Answer: B
Explanation: A) Testosterone is an androgen, so increased testosterone levels likely would not exacerbate SLE.
B) Sex hormones are thought to influence the development of SLE. In particular, increased estrogen levels are shown to enhance antibody responses and have an adverse effect in clients with SLE.
C) Reduced androgen levels are shown to enhance antibody responses and have an adverse effect in clients with SLE.
D) Serotonin is a neurotransmitter and typically not considered a hormone, and it does not play a direct role in the exacerbation of SLE.
Page Ref: 576
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 8.D.1. Analyze systemic lupus erythematosus (SLE) as it relates to immunity. Describe the etiology of SLE.
MNL LO: Demonstrate understanding of the concept of immunity in the care of a patient with systemic lupus erythematosus.

Module 9 Infection

The Concept of Infection

1) Which actions should the nurse take to help the client with bowel and bladder dysfunction reduce the risk of infection? **Select all that apply.**
A) Isolate the client using transmission-based precautions.
B) Monitor intake and output.
C) Provide hygienic care after episodes of incontinence.
D) Use standard precautions when handling linen after episodes of incontinence.
E) Limit fluid intake.
Answer: B, C, D
Explanation: A) Isolating the client using transmission-based precautions is not necessary because these precautions are meant to prevent the spread of infection from the client to others, and this client is not currently experiencing infection.
B) Monitoring intake and output is important because it can help reveal whether a client is experiencing dehydration. Dehydration may lead to urinary stasis, which increases the risk of infection. Similarly, intake and output levels can help reveal urinary retention, which also heightens the risk of infection.
C) Providing hygienic care after episodes of bowel or bladder incontinence will ensure that the skin remains intact, reducing the risk of infection.
D) Using proper biohazard precautions after episodes of incontinence will also reduce the risk of transmitting an infection.

E) Limiting fluid intake increases infection risk by putting the client at greater risk for dehydration.
Page Ref: 605, 624
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: V.B.1. Demonstrate effective use of technology and standardized practices that support safety and quality. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.3. Outline the relationship between infection and other concepts.
MNL LO: Analyze the concept of infection and its application to nursing care.

2) The nurse is planning an in-service on preventing infection for the staff nurses on a hospital's medical-surgical unit. Which information should be the priority teaching point for this education?
A) Raising the temperature in each client's room
B) Assessing vital signs once daily
C) Wearing a mask for client care
D) Performing hand hygiene
Answer: D
Explanation: A) Raising the temperature in a client's room would contribute to the growth of microorganisms.
B) Assessing vital signs is important but should be done more frequently than once daily.
C) Wearing a mask for all clients is not practical and is unnecessary unless a microorganism is airborne and the client is in isolation.
D) Hand hygiene is always the first and best way to stop the spread of microorganisms, which cause infections.
Page Ref: 597
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: V.B.1. Demonstrate effective use of technology and standardized practices that support safety and quality. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Quality & Safety: Current best practices. | Nursing Process: Planning
Learning Outcome: 9.4. Explain health promotion and infection prevention.
MNL LO: Analyze the concept of infection and its application to nursing care.

3) The nurse is assessing a client who is recovering following surgery. Which factor would increase this client's susceptibility to infection?
A) Intact mucous membranes
B) Presence of an incision
C) Dry skin
D) Active bowel sounds
Answer: B
Explanation: A) Intact mucous membranes is a factor that helps defend the body against infection.
B) This client has a surgical incision, so the body's first line of defense, the skin, is not intact.
C) Dry skin is a factor that helps defend the body against infection.
D) The presence of active bowel sounds is a factor that helps defend the body against infection.
Page Ref: 595
Cognitive Level: Understanding
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Learning Outcome: 9.2. Differentiate alterations that occur as a result of the infectious process.
MNL LO: Analyze the concept of infection and its application to nursing care.

4) The nurse is caring for a client being discharged with an abdominal surgical wound. Which instruction is most important for the nurse to teach this client regarding wound healing?
A) "Thoroughly irrigate the wound with hydrogen peroxide once a day."
B) "Apply a lubricating lotion to the edges of the wound twice a day."
C) "Add more fruits and vegetables to your diet."
D) "Notify the healthcare provider if you notice swelling, warmth, or tenderness at the wound site."
Answer: D
Explanation: A) Irrigating with hydrogen peroxide would break down good granulating tissue, so this would not increase healing.
B) Applying lubricating lotion to the edges of a wound would impede the healing process.
C) Increasing fruits and vegetables would increase vitamin C, which helps with wound healing, but more protein would be the best choice.
D) A client being discharged with a surgical wound has to be instructed on the detection of infection, as the skin is the first line of defense. Signs such as edema, heat, and tenderness would indicate a local infection.
Page Ref: 596-597, 604-605

Learning Outcome: 9.5. Differentiate common assessment procedures and tests used to examine the individual's infection status.
MNL LO: Analyze the concept of infection and its application to nursing care.

WwW.TeSM.Us

5) The nurse is caring for a client who is exhibiting signs of a systemic infection following surgery. Which diagnostic tests would the nurse anticipate being ordered? **Select all that apply.**
A) Serum electrolyte levels
B) Urinalysis
C) White blood cell differential
D) White blood cell count
E) Wound culture
Answer: B, C, D, E
Explanation: A) Serum electrolyte levels are not used to determine the presence of a systemic infection.
B) Urinalysis is used to assess for the presence of bacteria or blood in the urine.
C) WBC differential provides the body's response to an infection.
D) WBC count provides information that an infection is present.
E) Wound cultures are used to identify probable microorganisms.

Learning Outcome: 9.5. Differentiate common assessment procedures and tests used to examine the individual's infection status.
MNL LO: Analyze the concept of infection and its application to nursing care.

NwW.TBSM.Ws

6) The nurse is teaching a class on infection control. Which nursing measure is most appropriate in breaking a link in the chain of infection?
A) Place contaminated linens in a paper bag.
B) Use personal protective equipment (PPE).
C) Cover one's cough by placing the mouth in the hand.
D) Wear sterile gloves for client care.
Answer: B
Explanation: A) Placing linens in a paper bag would allow germs to come out through the bag, and the linen would act as a fomite, thus allowing the chain to continue.
B) PPE, according to Occupational Safety and Health Administration (OSHA) standards, has to be used whenever the situation dictates and is a nursing measure to break a link in the chain of infection.
C) Covering one's mouth when coughing prevents airborne droplets from escaping into the air for others to contract in the chain of infection. However, the cough should be covered in the elbow, not in the hand.
D) Nonsterile gloves have to be worn when providing certain aspects of client care. The gloves should be changed between clients, and hands are to be washed.
Page Ref: 603, 607, 609-610
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: V.A.1. Examine human factors and other basic safety design principles as well as commonly used unsafe practices (such as, work-arounds and dangerous abbreviations). | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.1. Analyze the process of infection in the body.
MNL LO: Analyze the concept of infection and its application to nursing care.

7) The nurse is teaching a child care class for mothers of young children. Which action should the nurse teach as being the most common mode of transmission of infectious disease?
A) Children who are playing board games
B) Children who are sitting together eating meals
C) Children who are playing with the same toy
D) Children who don't wash their hands after using the bathroom
Answer: D
Explanation: A) Playing with board games will not transmit infectious disease.
B) Eating together will not transmit infectious disease.
C) Microorganisms might be left on toys that children share, but this is not the most common mode of transmission of infectious diseases.
D) The fecal-oral and respiratory routes are the most common sources of transmission in children. Poor hand hygiene is a common source of transmission.

Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 9.8. Differentiate considerations related to the assessment and care of patients with infections throughout the lifespan.

MNL LO: Analyze the concept of infection and its application to nursing care.

8) A client is receiving IV antibiotics for the treatment of a *Staphylococcus aureus* infection. Which nursing interventions are appropriate when providing care to this client? **Select all that apply.**

A) Encourage adequate fluid intake.
B) Monitor for allergic reaction.
C) Assess renal and liver function.
D) Assess pain level.
E) Monitor vital signs.

Answer: A, B, C, E

Explanation: A) Nursing interventions to support antibiotic therapy include encouraging adequate fluid intake.

B) Nursing interventions to support antibiotic therapy include monitoring for manifestations of an allergic reaction.

C) Nursing interventions to support antibiotic therapy include assessing renal and hepatic function.

D) Although some clients may experience pain related to staph infection, antibiotics do not address pain, so assessment of pain levels is not related to administration of these medications.

E) Nursing interventions to support antibiotic therapy include assessing vital signs.

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 9.7. Summarize collaborative therapies used by interprofessional teams for patients with infections.
MNL LO: Analyze the concept of infection and its application to nursing care.

9) The healthcare provider prescribes a client to have peak and trough blood levels drawn to evaluate the therapeutic effect of an IV antibiotic. At which time should the nurse schedule the blood samples to be drawn? **Select all that apply.**
A) Prior to discontinuing the antibiotic
B) A few minutes before the next scheduled dose of medication
C) During the infusion of the antibiotic
D) 30 minutes after the IV administration
E) 1 to 2 hours after the oral administration of the medication
Answer: B, D
Explanation: A) Antibiotic trough levels are not drawn prior to discontinuing the antibiotic.
B) The trough level is usually drawn a few minutes before the next scheduled dose.
C) Antibiotic trough levels are not drawn while the medication is being provided.
D) Peak levels are drawn at specific times such as 1-2 hours after oral administration, 1 hour after intramuscular administration, and 30 minutes after IV administration.
E) A peak level would occur 1 to 2 hours after an oral dose.
Page Ref: 615
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 9.5. Differentiate common assessment procedures and tests used to examine the individual's infection status.

MNL LO: Analyze the concept of infection and its application to nursing care.

10) A pregnant client tested positive for group B *Streptococcus* (GBS) during her 36-week checkup. For which intervention should the nurse prepare the client in order to prevent transmission of infection to the neonate?
A) Not breastfeeding the neonate during the first week after birth
B) Administration of antibiotics to the neonate after birth
C) Delivery by cesarean section
D) Administration of antibiotics to the client during labor
Answer: D
Explanation: A) GBS is not transmitted to the neonate through breastfeeding.
B) Antibiotics are not given to the neonate after birth.
C) A positive GBS test does not require cesarean delivery.
D) GBS can be transmitted to the newborn during delivery. Administration of antibiotics during labor and delivery can prevent this transmission, so the nurse should prepare the mother for this intervention.
Page Ref: 627
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.6. Describe how the strength and relevance of available evidence influences the choice of interventions in provision of patient-centered care. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 9.8. Differentiate considerations related to the assessment and care of patients with infections throughout the lifespan.

MNL LO: Analyze the concept of infection and its application to nursing care.

11) Which type of infection is associated with the delivery of healthcare services in a facility such as a hospital or nursing home?
A) Etiologic
B) Latent
C) Healthcare-associated
D) Hospital-associated
Answer: C
Explanation: A) All infections are etiologic; they are produced by a specific organism.
B) A latent infection is an infection that is present but not active.
C) A healthcare-associated infection is an infection that is associated with the delivery of healthcare services in a facility such as a hospital or nursing home. Nurses must be diligent about hand hygiene and other safety practices to prevent healthcare-associated infections.
D) Hospital-associated is not a classification of an infection.
Page Ref: 601
Cognitive Level: Remembering
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.2. Differentiate alterations that occur as a result of the infectious process.
MNL LO: Analyze the concept of infection and its application to nursing care.

12) Which agent can be used to destroy pathogens other than spores?
A) Antiseptic
B) Disinfectant
C) Sterilizing agent
D) Isolating agent
Answer: B
Explanation: A) Antiseptics only inhibit the growth of some organisms.
B) Disinfectants destroy pathogens other than spores.
C) A sterilizing agent destroys all pathogens, including spores.
D) Isolation is used to prevent the spread of infection but does not destroy any pathogens.
Page Ref: 606
Cognitive Level: Remembering
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.4. Explain health promotion and infection prevention.
MNL LO: Analyze the concept of infection and its application to nursing care.

13) Which client should the nurse anticipate will have the greatest psychosocial needs?
A) A client under standard precautions
B) A client taking antibiotics
C) A client under droplet precautions
D) A client in isolation
Answer: D
Explanation: A) All clients receive standard precautions.
B) Clients taking antibiotics may have psychosocial needs, but they will not be as severe as those of the client in isolation.
C) Clients on droplet precautions may have psychosocial needs, but they will not be as severe as those of the client in isolation.
D) Clients requiring isolation precautions can develop psychosocial problems related to their separation from other people, including sensory deprivation and decreased self-esteem. The nurse will need to provide additional care for these clients to promote their psychosocial health.
Page Ref: 606
Cognitive Level: Understanding
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 9.6. Analyze independent interventions nurses can implement for patients with infection.
MNL LO: Analyze the concept of infection and its application to nursing care.

14) The nurse is caring for a client with gangrene of the toe. For which collaborative intervention should the nurse anticipate preparing the client?
A) Surgery
B) Debridement
C) Myringotomy
D) Wound irrigation
Answer: A
Explanation: A) Surgical intervention is the primary collaborative treatment for gangrene.
B) Debridement is used to remove dead tissue and debris from a wound.
C) Myringotomy is used to remove infected inner ear drainage.
D) Wound irrigation is used to remove dead tissue and debris from a wound; however, it is not used for gangrenous infections.
Page Ref: 625
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 9.7. Summarize collaborative therapies used by interprofessional teams for patients with infections.
MNL LO: Analyze the concept of infection and its application to nursing care.

Exemplar 9.A Cellulitis

1) The nurse is caring for a client who is admitted with cellulitis of the foot. Which assessment findings support this diagnosis?
A) Blood urea nitrogen (BUN) and creatinine
B) Breath sounds
C) Blood cultures
D) Redness, pain, and edema at the site
Answer: D
Explanation: A) BUN and creatinine are not nursing assessments.
B) Breath sounds are not indicated at present, as the infection is in the foot.
C) Blood cultures are ordered by the physician and are not nursing assessments.
D) Classic signs of cellulitis are swelling, pain, redness, and edema at the site.
Page Ref: 639
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Identify the clinical manifestations of cellulitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

2) The nurse is teaching a group of adolescents at a local high school about skin infections. Which students should the nurse identify as being at increased risk for developing cellulitis? **Select all that apply.**

A) A student who plucks her eyebrows
B) A student with diabetes
C) A student who is a member of the golf team
D) A student who squeezes pimples
E) A student who applies moisturizer on a daily basis

Answer: A, B, D

Explanation: A) The student who plucks her eyebrows risks an infected hair follicle, which can lead to cellulitis.

B) The student with diabetes has a weakened immune system and increased risk for nerve damage and vascular changes in the extremities, which can lead to increased potential for skin injury and cellulitis.

C) Noncontact sports like golf do not pose a risk for cellulitis.

D) The student who squeezes pimples can develop a skin infection.

E) Keeping the skin well moisturized can protect against skin breakdown and thus reduce the risk for cellulitis.

Page Ref: 638, 640

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Compare the risk factors and prevention of cellulitis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

3) The nurse is caring for a client who is hospitalized for cellulitis of the foot. Which problems should the nurse use to plan this client's care? **Select all that apply.**
A) Social isolation because of the skin infection
B) Compromised skin integrity
C) Acute pain
D) Problems with sleeping
E) Low self-esteem
Answer: B, C
Explanation: A) There is no evidence that the client has a problem with social isolation.
B) Clients with cellulitis have a problem with compromised skin integrity.
C) Clients with cellulitis have a problem with acute pain.
D) Clients with cellulitis would not necessarily have problems with sleeping.
E) Clients with cellulitis do not necessarily have low self-esteem.
Page Ref: 640
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with cellulitis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

4) The nurse is teaching a client with cellulitis about ways to promote healing and avoid future infections. Which client statements indicate that the teaching has been effective? **Select all that apply.**
A) "I should use antibiotic soap to cleanse my wound."
B) "I must keep my wound completely dry between cleansings."
C) "I should contact the doctor if I have a temperature of 99.5°F or higher."
D) "I should avoid swimming in lakes when I have a wound."
E) "I can stop taking antibiotics when the swelling subsides."
Answer: A, D
Explanation: A) Clients with cellulitis should wash affected areas with antibacterial soap to prevent the spread of infection.
B) Wounds should be kept at a proper moisture level as instructed, because wet or moist wounds heal faster than dry wounds.
C) The healthcare provider should be contacted for a body temperature of 101°F or higher.
D) Clients should avoid swimming in lakes when wounded, as the water may be contaminated and could cause an infection.
E) Antibiotics are taken for the full course ordered, not just until the swelling subsides.
Page Ref: 641
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with cellulitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

5) A client receiving intravenous antibiotics for 3 days as treatment for cellulitis is being prepared for discharge. Which discharge order should the nurse anticipate for this client?
A) Low-sodium diet prescribed
B) Home healthcare aide for the client
C) Oral antibiotics to be continued at home
D) Orders for evaluation by physical therapy
Answer: C
Explanation: A) A low-sodium diet is not indicated for cellulitis.
B) The client may or may not need a home health aide.
C) Antibiotics should be taken for 10 days; therefore, the nurse anticipates oral antibiotics to be continued at home.
D) There is no evidence to suggest the client needs physical therapy.
Page Ref: 641
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with cellulitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

6) The nurse is providing discharge instructions to a client recovering from cellulitis. Which client statement indicates that this teaching has been effective?
A) "I will monitor for signs of infection such as fever, chills, malaise, and redness or tenderness at the site."
B) "If the lesion looks healed, I will stop taking the antibiotics so that I will not develop resistance to antibiotics."
C) "If pustules develop, I will squeeze the lesion to remove the pus."
D) "Drainage from the site is an expected finding, and I should not be concerned."
Answer: A
Explanation: A) The client will need to be taught to monitor for the signs and symptoms of infection. Infection may be manifested by fever, chills, erythema, tenderness, and drainage at the site, especially if it is cloudy or serous.
B) Stopping antibiotics before the doses are complete causes resistance.
C) Pustules are never to be squeezed open, as there is risk of greater infection.
D) Changes in the color, amount, and odor from drainage are cause for concern and should be monitored. The physician must be notified if these symptoms occur.
Page Ref: 641
Cognitive Level: Analyzing
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Identify the clinical manifestations of cellulitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

7) When providing care to a client with a wound, which evidence-based interventions should the nurse anticipate carrying out? **Select all that apply.**
A) Keeping the wound dry
B) Only covering the wound if a scab forms
C) Ensuring that the wound remains moist
D) Keeping the wound covered
E) Teaching the client that proper wound management can reduce scarring
Answer: C, D, E
Explanation: A) Many people believe that wounds should be kept dry and should not be covered until a scab forms. However, this slows wound healing and leaves the wound exposed to potential pathogens if the scab comes off.
B) Many people believe that wounds should be kept dry and should not be covered until a scab forms. However, this slows wound healing and leaves the wound exposed to potential pathogens if the scab comes off.
C) Wound covering helps maintain a moist environment, decreasing the chance of infection.
D) Wound covering helps maintain a moist environment, decreasing the chance of infection.
E) Proper wound moisture management improves the cosmetic outcome.
Page Ref: 641
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Compare the risk factors and prevention of cellulitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

8) On which region of the body would the nurse most expect to observe erysipelas?
A) Abdomen
B) Ankles
C) Neck
D) Back
Answer: B
Explanation: A) Erysipelas, a superficial cellulitis of the skin caused by group A S*treptococcus*, usually affects the lower extremities or the face and not the abdomen.
B) Erysipelas, a superficial cellulitis of the skin caused by group A *Streptococcus*, usually affects the lower extremities or the face. The involved area is bright red and raised with well-defined borders.
C) Erysipelas, a superficial cellulitis of the skin caused by group A *Streptococcus*, usually affects the lower extremities or the face and not the neck.
D) Erysipelas, a superficial cellulitis of the skin caused by group A *Streptococcus*, usually affects the lower extremities or the face and not the back.
Page Ref: 638
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Describe the pathophysiology of cellulitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

9) The nurse is caring for a client who has been diagnosed with orbital cellulitis. Which assessment finding should the nurse anticipate?
A) Sunken eyes
B) Edema of the affected eye
C) Increased acuity of the affected eye
D) Elevated blood pressure
Answer: B
Explanation: A) Edema of the affected site is a common symptom of cellulitis. This would not cause sunken eyes.
B) Edema of the affected site is a common symptom of cellulitis. This may cause bulging eyes.
C) The client may complain of decreased vision, not increased acuity of vision.
D) Blood pressure is unrelated to orbital cellulitis.
Page Ref: 640
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Differentiate care of patients with cellulitis across the lifespan.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

10) Which organism is most commonly responsible for cellulitis?
A) *Staphylococcus epidermidis*
B) *Streptococcus pneumoniae*
C) *Streptococcus viridans*
D) *Staphylococcus aureus*
Answer: D
Explanation: A) *Staphylococcus epidermidis* produces other types of infections.
B) *Streptococcus pneumonia*e produces other types of infections.
C) *Streptococcus viridans* produces other types of infections.
D) The most common causative organism of cellulitis is *Staphylococcus aureus*, followed by methicillin-resistant *Staphylococcus aureus* and then group A *Streptococcus*.
Page Ref: 638
Cognitive Level: Remembering
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Describe the etiology of cellulitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

11) The nurse caring for a client with cellulitis can expect to collaborate with which other member of the healthcare team?
A) Clinical psychologist
B) Social worker
C) Wound care specialist
D) Respiratory therapist
Answer: C
Explanation: A) Clinical psychologists are typically not involved in the care of most clients with cellulitis.
B) Social workers are typically not involved in the care of most clients with cellulitis.
C) Cellulitis is an acute bacterial infection of the dermis and underlying connective tissue. It usually occurs as a complication of a wound infection; thus, a wound care specialist is often used to promote a positive wound care plan.
D) Respiratory therapists are typically not involved in the care of most clients with cellulitis.
Page Ref: 639
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: II.A.4. Recognize contributions of other individuals and groups in helping patient/family achieve health goals. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Teamwork: Scope of practice, roles, and responsibilities of healthcare team members, including overlaps. | Nursing Process: Implementation
Learning Outcome: 9.A. Analyze cellulitis as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with cellulitis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with cellulitis.

Exemplar 9.B Conjunctivitis

1) The nurse is assessing a college student who presents with red, swollen eyes; photophobia; and yellowish drainage from the conjunctiva. Which question should the nurse ask the client first?
A) "Have you had extra caffeine this week?"
B) "Did you get sand in your eye recently?"
C) "Have you been exposed to HIV?"
D) "Have any of your friends experienced these symptoms?"
Answer: D
Explanation: A) Exposure to caffeine is not a known cause of conjunctivitis and the question would not be appropriate to ask this client to determine the cause of the symptoms.
B) Sand in the eye is not a known cause of conjunctivitis and the question would not be appropriate to ask this client to determine the cause of the symptoms.
C) Exposure to HIV is not a known cause of conjunctivitis and the question would not be appropriate to ask this client to determine the cause of the symptoms.
D) The client is exhibiting signs and symptoms of conjunctivitis. The nurse should explore ways in which the client may have been exposed. Most cases of conjunctivitis are spread by hand to eye contact.
Page Ref: 644
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 9.B. Analyze conjunctivitis as it relates to infection. Describe the etiology of conjunctivitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with conjunctivitis.

2) When planning care for a client with trachoma, which potential complication should the nurse consider?

A) Scarring of the cornea
B) Eye muscle weakness
C) Damaged iris
D) Retinal detachment

Answer: A

Explanation: A) Trachoma is a chronic form of conjunctivitis that causes the formation of granulation tissue that is abraded by the lashes, leading to scarring of the cornea and eventual blindness.

B) Trachoma does not cause eye muscle weakness.

C) Trachoma does not damage the iris.

D) Trachoma does not cause a detached retina.

Page Ref: 645

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 9.B. Analyze conjunctivitis as it relates to infection. Identify the clinical manifestations of conjunctivitis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with conjunctivitis.

3) The nurse is teaching a mother how to administer optical antibiotics to her child who has conjunctivitis. Which statement made by the mother indicates teaching has been effective?
A) "I will drop the medication onto the eyeball."
B) "I will wait 10 seconds between drops."
C) "I will wash my hands before instilling the medication."
D) "I will rub the eye with a cotton ball after I administer the medication."
Answer: C
Explanation: A) Medication is dropped into the lower conjunctival sac.
B) The time between drops is 1 to 5 minutes, depending on the type of medication.
C) Teach the client to wash hands thoroughly before and after instilling eye medications. Handwashing is the single most important means of preventing transmission of infection.
D) The eyes should not be rubbed after instillation.
Page Ref: 647
Cognitive Level: Analyzing
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 9.B. Analyze conjunctivitis as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with conjunctivitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with conjunctivitis.

4) The nurse is providing care for a pediatric client with bacterial conjunctivitis. Which interventions should the nurse use as part of the collaborative management of the client? **Select all that apply.**

A) Recommending dark sunglasses
B) Recommending removing contacts at night
C) Contacting the client's school nurse
D) Performing careful hand hygiene
E) Administering antiviral therapy

Answer: A, C, D

Explanation: A) Dark glasses will help to reduce the photophobia that many clients with conjunctivitis experience.
B) Contacts should not be worn during conjunctivitis.
C) It is often appropriate for the nurse to contact the client's school nurse to discuss increased prevention and student education.
D) Careful hand hygiene is a standard method for managing the client with conjunctivitis.
E) Antibiotics, not antiviral medications, are prescribed with conjunctivitis.

Page Ref: 646
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.B. Analyze conjunctivitis as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with conjunctivitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with conjunctivitis.

5) The nurse is providing discharge instructions for a client who has acute conjunctivitis from *Staphylococcus*. Which information should the nurse include when teaching this client? **Select all that apply.**
A) "It is OK to share makeup once the infection has resolved."
B) "Do not share towels, makeup, or contact lenses with anyone else, as this can spread the infection."
C) "You can soak your eyelids with a warm cloth to soften crusts and exudates that may form."
D) "Wash your hands before cleansing the eye and administering eye drops."
E) "You may rub your eyes if they are itchy."
Answer: B, C, D
Explanation: A) Sharing supplies, such as makeup is never a good idea even after the infection is cleared, due to potential for cross-contamination.
B) Sharing supplies, such as towels, make-up, or contact lenses, is never a good idea even after the infection is cleared, due to potential for cross-contamination.
C) Soaking the lids with a warm cloth will soften the crusts from exudates that accompany the *Staphylococcus* infection.
D) Handwashing (hand hygiene) will minimize the risk of bringing in other organisms to an already infected eye.
E) The action of rubbing one's eyes can traumatize the eyes further and increase the risk of cross-contamination.
Page Ref: 647-648
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.B. Analyze conjunctivitis as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with conjunctivitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with conjunctivitis.

6) The nurse is assessing a client who presents with purulent drainage and crusting of the eye. The nurse should recognize that these findings are most consistent with which type of infection?
A) Viral conjunctivitis
B) Allergic conjunctivitis
C) Bacterial conjunctivitis
D) Fungal conjunctivitis
Answer: C
Explanation: A) The discharge from viral conjunctivitis is serous (watery).
B) Allergic conjunctivitis produces watery to thick drainage and is characterized by itching.
C) Bacterial conjunctivitis has a purulent discharge that may result in crusting.
D) Fungi do not cause conjunctivitis.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.B. Analyze conjunctivitis as it relates to infection. Identify the clinical manifestations of conjunctivitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with conjunctivitis.

7) Which term is commonly used by clients to describe conjunctivitis?
A) Stye
B) Pink eye
C) Red eye
D) Retinitis
Answer: B
Explanation: A) A stye is a pimple-like infected oil gland on or near the edge of the eyelid.
B) Clients commonly refer to conjunctivitis as "pink eye."
C) Conjunctivitis is not referred to as red eye.
D) Retinitis is a disease related to the retina, not the conjunctiva of the eye. Retinitis causes vision loss, not inflammation, redness, and discharge.
Page Ref: 643
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.B. Analyze conjunctivitis as it relates to infection. Describe the pathophysiology of conjunctivitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with conjunctivitis.

WwW.TeSt.Ws

8) A client who uses extended-wear contact lenses should be taught measures for reducing the risk of which condition?
A) Conjunctivitis
B) Cataracts
C) Glaucoma
D) Macular degeneration
Answer: A
Explanation: A) Individuals who use extended-wear contact lenses are at higher risk of developing conjunctivitis. Therefore, client teaching should include prevention of eye infections.
B) The client is not at risk for cataracts because of the contact lenses.
C) The client is not at risk for glaucoma because of the contact lenses.
D) The client is not at risk for macular degeneration because of contact lenses.
Page Ref: 648
Cognitive Level: Understanding
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.B. Analyze conjunctivitis as it relates to infection. Compare the risk factors and prevention of conjunctivitis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with conjunctivitis.

9) A labor and delivery nurse is providing care for a neonate in the first few minutes after birth. Which medication will the nurse provide to promote eye health and prevent conjunctivitis in the infant?
A) Oral tetracycline
B) Erythromycin as an eye ointment
C) Ceftriaxone as an eye drop
D) Parenteral acyclovir
Answer: B
Explanation: A) Tetracycline may be used instead of erythromycin immediately after birth, but it will be used as an eye ointment, not as an oral formulation.
B) Prevention of conjunctivitis in a newborn is provided by the administration of an antibiotic eye ointment, usually erythromycin.
C) Ceftriaxone is only administered for a confirmed case of gonococcal conjunctivitis.
D) Parenteral acyclovir is only administered for a confirmed case of conjunctivitis due to herpes simplex virus.
Page Ref: 646-647
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.B. Analyze conjunctivitis as it relates to infection. Differentiate care of patients with conjunctivitis across the lifespan.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with conjunctivitis.

Exemplar 9.C Influenza

1) The nurse is caring for a client who presents with acute malaise, muscle aches, and fever. Which additional assessment findings should the nurse recognize as consistent with influenza? **Select all that apply.**

A) No history of vaccinations within the past 12 months
B) Nonproductive cough
C) Hypotension
D) Difficulty urinating
E) Dizziness
Answer: A, B
Explanation: A) Based on the presenting symptoms, the nurse would ask whether the client has had a seasonal flu shot or recently been exposed to the flu.
B) Usually, the cough of a client with influenza is nonproductive.
C) Hypotension is not a manifestation of influenza.
D) Difficulty urinating is not a manifestation of influenza.
E) Dizziness is not a manifestation of influenza.
Page Ref: 650-651
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 9.C. Analyze influenza as it relates to infection. Identify the clinical manifestations of influenza.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

2) The nurse is working in a primary care setting. Which clients should the nurse identify as being at high risk for influenza or its complications? **Select all that apply.**
A) A 25-year-old pregnant woman at 20 weeks' gestation
B) A 65-year-old woman
C) A 3-year-old with cystic fibrosis
D) A 35-year-old man with a severe allergy to eggs
E) A 20-year-old healthcare worker
Answer: A, B, C, E
Explanation: A) People at increased risk of influenza or its complications include pregnant clients.
B) People at increased risk of influenza or its complications anyone age 50 or older.
C) Patients with chronic disorders, especially pulmonary diseases, are more susceptible as well.
D) A man with an allergy to eggs is not at increased risk for influenza or its complications.
E) Healthcare workers have increased risk of exposure to influenza.
Page Ref: 650
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.C. Analyze influenza as it relates to infection. Compare the risk factors for and prevention of influenza.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

3) Which information should the nurse include when teaching parents of pediatric clients about ways to decrease the spread of influenza? **Select all that apply.**
A) "Cover your cough" education
B) An explanation of appropriate hand hygiene
C) Methods for safe food preparation and storage
D) Where to obtain the influenza vaccine
E) The importance of withholding immunizations for children with compromised immune systems
Answer: A, B, D
Explanation: A) Teaching children to use respiratory etiquette helps control the growth and spread of microorganisms.
B) Teaching children to wash their hands helps control the growth and spread of microorganisms.
C) Teaching parents safe food preparation and storage is another tool to prevent the spread of microorganisms, but it is not related to the flu virus.
D) The influenza vaccine can decrease each child's susceptibility to influenza infection.
E) Immunizations should not be withheld from immunocompromised children.
Page Ref: 650, 654
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 9.C. Analyze influenza as it relates to infection. Compare the risk factors for and prevention of influenza.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

W W . T B S M . W S

4) Which action should the nurse take to promote effective breathing in a client with respiratory manifestations of the flu? **Select all that apply.**

A) Maintain adequate hydration.
B) Teach the client coughing and deep breathing.
C) Prepare the client for the possibility of a tracheostomy tube.
D) Keep the head of the bed elevated.
E) Administer antitussives during the day.

Answer: A, B, D

Explanation: A) Hydration thins the mucus and also aids in clearing the airway.
B) Coughing and deep breathing are essential for achieving airway clearance.
C) Insertion of a tracheostomy and oxygen are not primary treatments for ineffective airway clearance.
D) Keeping the head of the bed elevated improves lung excursion and reduces the work of breathing.
E) Antitussives should be administered at night to promote sleep but should not be administered during the day to promote airway clearance through coughing.

Page Ref: 653
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Learning Outcome: 9.C. Analyze influenza as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with influenza.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

WwW.TeSm.Us

5) The nurse makes a home visit to a client recovering from influenza. Which client statements indicate that desired outcomes have been met? **Select all that apply.**
A) "I'm eating healthy foods now."
B) "I went back to work."
C) "I haven't had chills since I left the hospital."
D) "I slept the whole night without coughing."
E) "I was able to take a walk today."
Answer: C, D
Explanation: A) Eating a healthy diet does not indicate that the client's flu has resolved.
B) Returning to work does not indicate that the client's flu has resolved.
C) Desired outcomes for a client recovering from the flu include absence of symptoms of acute infection (such as fever and chills).
D) Desired outcomes for a client recovering from the flu include resolution of respiratory symptoms and resumption of normal sleep-rest patterns.
E) Being able to walk does not indicate that the client's flu has resolved.
Page Ref: 654
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 9.C. Analyze influenza as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with influenza.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

6) The nurse is reviewing diagnostic and laboratory studies performed for a client with influenza. Which result should the nurse recognize as being consistent with influenza?
A) Decreased white blood cell count
B) Increased BUN
C) Decreased sodium level
D) Fluid-filled lungs on chest x-ray
Answer: A
Explanation: A) The white blood cell count of a client with influenza will typically be decreased.
B) Laboratory tests for BUN are not usually associated with influenza.
C) Sodium levels are not usually associated with influenza.
D) Unless the client with influenza develops complications, the chest x-ray is clear.
Page Ref: 651
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.C. Analyze influenza as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with influenza.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

7) Which interventions should the nurse incorporate into the plan of care for a client diagnosed with influenza? **Select all that apply.**
A) Placing droplet and contact precaution signs on the client's room door
B) Placing the client in a negative air flow room
C) Placing a ventilator in the room
D) Notifying other departments of the diagnosis
E) Using appropriate PPE
Answer: A, E
Explanation: A) To prevent the spread of influenza, the client is placed in a private room with signs for droplet and contact precautions.
B) Negative air flow rooms are for diseases such as chickenpox, measles, and severe acute respiratory syndrome (SARS).
C) There is no indication that this client will need a ventilator.
D) Placing signs on the door is the way to notify other departments of precautions; no additional notification is needed.
E) It is important for healthcare workers to use appropriate PPE for these transmission-based precautions.
Page Ref: 654

Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 9.C. Analyze influenza as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with influenza.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

8) Necrosis of respiratory epithelial cells and shedding of serous and ciliated cells of the respiratory tract produce which common symptom of influenza?

A) Malaise
B) Coryza
C) Cough
D) Rhinorrhea

Answer: D

Explanation: A) Malaise is a general symptom of influenza and is not directly related to the shedding of cells from the respiratory tract.

B) Serous cells are replaced more rapidly than ciliated cells, leading to coryza.

C) Serous cells are replaced more rapidly than ciliated cells, leading to continued cough.

D) Shedding of serous and ciliated cells of the respiratory tract leads to rhinorrhea, or a runny nose.

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 9.C. Analyze influenza as it relates to infection. Describe the pathophysiology of influenza.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

9) Because of the way the influenza virus is transmitted from person to person, which precaution should the nurse implement?
A) Droplet precautions
B) Isolation precautions
C) Airborne precautions
D) Contact precautions
Answer: A
Explanation: A) Influenza is spread through droplets when the client sneezes or coughs. Therefore, droplet precautions should be used.
B) Isolation precautions limit the number of people who come in contact with the client and are used only for severe or life-threatening infections.
C) Airborne precautions are used for tuberculosis and other infections that are airborne.
D) Contact precautions are used when the nurse is at risk of contracting infected body fluids such as stool or wound drainage.
Page Ref: 654
Cognitive Level: Understanding
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.C. Analyze influenza as it relates to infection. Describe the etiology of influenza.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

10) Which oral antiviral drug that is commonly prescribed for influenza A and B works by preventing the release of newly formed virus?

A) Rimantadine (Flumadine)
B) Zanamivir (Relenza)
C) Oseltamivir (Tamiflu)
D) Amantadine (Symmetrel)

Answer: C

Explanation: A) Rimantadine (Flumadine) is no longer recommended for the prevention or treatment of influenza because of the high incidence of resistance by the influenza virus.
B) Zanamivir (Relenza) has a similar mechanism of action, but it is given via inhalation.
C) Oseltamivir (Tamiflu) is an oral antiviral drug that is prescribed for influenza A and B. It works by preventing the release of newly formed virus.
D) Amantadine (Symmetrel) is no longer recommended for the prevention or treatment of influenza because of the high incidence of resistance by the influenza virus.

Page Ref: 623
Cognitive Level: Understanding

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

11) Which action should the nurse recommend for a pregnant client who is concerned about a recent flu outbreak?
A) Receive the influenza vaccination.
B) Stay home until the influenza outbreak has ended.
C) Take amantadine (Symmetrel) prophylactically.
D) Eat foods that boost the immune system.
Answer: A
Explanation: A) The influenza vaccine is the client's best method of preventing influenza infection, and it has no indication of harm to the unborn child.
B) Recommending the client stay home for several weeks is not a practical method of prevention.
C) Amantadine is a Category C drug and should not be given during pregnancy to prevent influenza.
D) Although eating foods that boost the immune system is a good recommendation, it will not be as effective at preventing influenza in an exposed individual as the influenza vaccine.

WwW.TeSt.Ws

12) The nurse is caring for a group of clients with influenza. Which client should the nurse identify as being at greatest risk for complications?
A) A 53-year-old woman
B) A 72-year-old man
C) A 35-year-old woman
D) A 12-year-old boy
Answer: B
Explanation: A) A middle-aged client is not at the greatest risk of complications from influenza.
B) Older adults are more at risk because their immune defenses become weaker with age.
C) An adult client is not at the greatest risk of complications from influenza.
D) Children under the age of 5 are at highest risk of developing complications related to influenza infection.
Page Ref: 652
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with influenza.

Exemplar 9.D Otitis Media

1) The nurse walks into an examination room and sees a young child pulling at their ear. The nurse recognizes this behavior is most characteristic of which health problem?
A) Sore throat
B) Hunger
C) Otitis media
D) Head cold
Answer: C
Explanation: A) Pulling at the ear does not indicate a sore throat.
B) Pulling at the ear does not indicate hunger.
C) Pulling at the ear is a characteristic sign of otitis media in a young child.
D) Pulling at the ear does not indicate a head cold.
Page Ref: 656
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.D. Analyze otitis media as it relates to infection. Identify the clinical manifestations of otitis media.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

2) The nurse is caring for a client who refuses treatment for otitis media. Which condition is this client at risk for developing?
A) External otitis
B) Meningitis
C) Pneumonia
D) Influenza
Answer: B
Explanation: A) Otitis media is not known to cause external otitis.
B) The bacterial infection from otitis media may migrate internally, leading to the development of bacterial meningitis.
C) Otitis media does not cause pneumonia.
D) Otitis media does not cause influenza.
Page Ref: 655
Cognitive Level: Analyzing

Learning Outcome: 9.D. Analyze otitis media as it relates to infection. Compare the risk factors and prevention of otitis media.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

3) The nurse is teaching the mother of an infant with otitis media to manage the associated fever and pain. Which instruction by the nurse is correct?
A) Swaddle the baby in blankets.
B) Feed the baby solid foods.
C) Administer acetaminophen.
D) Bathe the baby with cool water.
Answer: C
Explanation: A) Swaddling the baby with blankets is not going to reduce the fever or help the pain.
B) The baby may not be of the age to take solid foods.
C) Acetaminophen will help reduce the child's fever and reduce the pain.
D) Bathing with cool water is not an appropriate intervention to reduce the fever of a baby.
Page Ref: 659
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 9.D. Analyze otitis media as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with otitis media.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

4) Which instruction should the nurse provide to an adolescent client with otitis media with regard to pain?

A) Apply a cold compress to the affected ear.

B) Report abrupt relief of pain immediately.

C) Continue plans for air travel.

D) Report increased pain when moving the outer ear.

Answer: B

Explanation: A) Heat should be applied to dilate surrounding blood vessels and decrease swelling.

B) Abrupt relief of pain may mean that the tympanic membrane has perforated.

C) Drastic changes in barometric pressure can increase pain considerably, so clients are discouraged from traveling by air.

D) The pain of otitis media is not aggravated by movement of the external ear.

Learning Outcome: 9.D. Analyze otitis media as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with otitis media.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

5) The nurse correctly explains to a young mother that bottle-feeding an infant in the upright position may help to prevent which infectious health problem?
A) Choking
B) Aspiration
C) Sinus infection
D) Otitis media
Answer: D
Explanation: A) Although choking can occur due to an improper position during bottle-feeding, they are not infectious health problems.
B) Although aspiration can occur due to an improper position during bottle-feeding, they are not infectious health problems.
C) Children are not prone to sinus infection during infancy as the result of feeding position.
D) Infants and small children who are bottle-fed in a supine position have a greater probability of developing otitis media because the eustachian tube opens when the child sucks, and the horizontal angle provides easy access to the middle ear.
Page Ref: 658
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Learning Outcome: 9.D. Analyze otitis media as it relates to infection. Differentiate care of patients with otitis media across the lifespan.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

6) A client has completed the full course of antibiotics prescribed to treat otitis media. Which primary manifestation of the disorder will be relieved as evidence that treatment has been effective?
A) Impaired hearing
B) Dizziness
C) Pain
D) Nausea and vomiting
Answer: C
Explanation: A) Impaired hearing is a secondary manifestation.
B) Dizziness is a secondary manifestation.
C) Ear pain is the most common symptom of otitis media that motivates the client to seek healthcare.
D) Nausea and vomiting are secondary symptoms.
Page Ref: 656
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 9.D. Analyze otitis media as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with otitis media.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

7) A toddler with otitis media is prescribed amoxicillin clavulanate 250 mg/5 mL three times daily by mouth for 10 days. Which information should the nurse teach the mother about this medication?
A) "It is OK to stop the antibiotic if the child begins to have side effects."
B) "Give the antibiotic for the full 10 days as prescribed."
C) "It is important to measure the prescribed dose in a household teaspoon."
D) "Be sure to administer a loading dose of the medication when you get home."
Answer: B
Explanation: A) Stopping the antibiotic before the prescribed time will permit remaining bacteria to reproduce, and the otitis media will return, possibly with antibiotic-resistant organisms.
B) Antibiotics must be administered for the full number of days ordered to prevent mutation of resistant strains of bacteria.
C) A household teaspoon could contain less than 5 mL, and the full dose must be given.
D) A loading dose was not ordered.
Page Ref: 657

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

8) The nurse is teaching the parents of an infant who is diagnosed with acute otitis media. Which information is the priority teaching point for these parents?
A) Administer a decongestant for nasal congestion.
B) Keep the baby in a flat position during sleep.
C) Administer acetaminophen to relieve pain and decrease fever.
D) Place the baby to sleep with a pacifier.
Answer: C
Explanation: A) Decongestants are not recommended for treatment of acute otitis media.
B) A flat position could exacerbate the discomfort.
C) Parents are taught to administer acetaminophen to relieve the discomfort and decrease fever associated with acute otitis media.
D) Placing infants to sleep with a pacifier can increase the incidence of otitis media.
Page Ref: 659

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

9) Which body structure provides a route by which infectious organisms can enter the middle ear to cause otitis media?
A) Nasopharynx
B) Eustachian tube
C) Tympanic membrane
D) Sinus cavity
Answer: B
Explanation: A) The nasopharynx does not directly connect to the middle ear.
B) The eustachian tube connects the middle ear with the nasopharynx, and this tube provides a route through which infectious organisms can enter the middle ear from the nose and throat.
C) The tympanic membrane separates the middle ear from the external auditory canal. It protects the middle ear from infectious organisms when it is intact.
D) The sinus cavity does not directly connect to the middle ear.
Page Ref: 655
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.D. Analyze otitis media as it relates to infection. Describe the pathophysiology of otitis media.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

10) Which child has a risk factor for developing otitis media?
A) A 10-year-old child who plays baseball and soccer
B) A 14-year-old child who lives on a farm
C) A 5-year-old child who stays with her grandmother during summer break
D) An 18-month-old child who attends daycare while his parents work
Answer: D
Explanation: A) A 10-year-old child is not at increased risk for otitis media.
B) A 14-year-old child is not at increased risk for otitis media.
C) A 5-year-old child is not at increased risk for otitis media.
D) Risk factors for developing otitis media include being younger than age 2, participating in group care settings, having seasonal allergies, or being exposed to poor air quality. The 18-month-old child has two risk factors for developing otitis media.
Page Ref: 655
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.D. Analyze otitis media as it relates to infection. Compare the risk factors and prevention of otitis media.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with otitis media.

Exemplar 9.E Pneumonia

1) An older adult client is admitted with pneumonia. Which manifestations would the nurse expect to find when assessing this client? **Select all that apply.**
A) Hemoptysis
B) Increased appetite
C) Cough
D) Tachypnea
E) Fever
Answer: A, C, D, E
Explanation: A) Common symptoms of pneumonia include hemoptysis.
B) Decreased appetite may accompany symptoms of pneumonia, not increased appetite.
C) Common symptoms of pneumonia include cough.
D) Common symptoms of pneumonia include tachypnea.
E) Common symptoms of pneumonia include fever.
Page Ref: 666
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Identify the clinical manifestations of pneumonia.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

2) An older adult client asks the nurse what can be done to decrease the risk of developing pneumonia. Which responses by the nurse are most appropriate? **Select all that apply.**
A) "Once per day, you should eat yogurt that is supplemented with *L. casei immunitas* cultures."
B) "Eliminating habits like smoking can help."
C) "You can get the pneumonia vaccination, which may help decrease your risk in the future."
D) "Avoiding alcohol will reduce your risk."
E) "There is nothing you can do to decrease your risk of pneumonia in the future."
Answer: B, C, D
Explanation: A) *L. casei immunitas* cultures have not been proven to support immune function.
B) Smoking increases the risk of pneumonia. Smoking injures tissues in the airways and decreases the action of the cilia.
C) Pneumonia vaccines can also decrease the risk of developing the disease in the future.
D) Alcohol consumption increases the risk of pneumonia. Alcohol interferes with the actions of macrophages.
E) Telling the client that it is not possible to decrease the risk of pneumonia is incorrect.
Page Ref: 665
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Compare the risk factors and prevention of pneumonia.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

3) The nurse is caring for an older adult client who is hospitalized with a second episode of pneumonia in the past 18 months. The client has expressed frustration to the nurse and states, "I never got sick when I was younger. Why is this happening?" Which response by the nurse is most appropriate?

A) "As you grow older, your immune system just quits working."

B) "As you grow older, there is a decrease in the immune response, which puts you at greater risk for developing an infection."

C) "As you grow older, there is an overall increase in the speed and strength of your immune response."

D) "As you grow older, there is an increase in the number of B cells in circulation, which hinders the immune response."

Answer: B

Explanation: A) The immune system does not quit working totally.

B) As a person grows older, there is an overall decrease in the speed and strength of the immune response.

C) As a person grows older, there is an overall decrease in the speed and strength of the immune response.

D) There is a decrease in the number of B cells in circulation.

Page Ref: 665

Cognitive Level: Applying

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Differentiate care of patients with pneumonia across the lifespan.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

4) The nurse is caring for a client with pneumonia. Which intervention should the nurse include in this client's plan of care to promote effective airway clearance?
A) Perform chest percussion every 4 hours and prn.
B) Administer the pneumococcal vaccine prior to discharge.
C) Limit fluid intake to 1000 mL per day.
D) Instruct the client to reduce the amount of smoking.
Answer: A
Explanation: A) Chest percussion can help clear secretions.
B) The pneumococcal vaccine would prevent the condition, not improve airway clearance.
C) Patients with pneumonia are encouraged to increase fluid intake.
D) The client should be provided with education on smoking cessation as this helps with airway clearance in the client with pneumonia.
Page Ref: 672
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with pneumonia.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

5) The nurse is providing discharge teaching to a client recovering from pneumonia. Which client statement indicates that additional teaching is needed?
A) "I can't get the influenza vaccine due to my allergy to eggs."
B) "I will get the influenza vaccine every year."
C) "I will get the pneumococcal vaccine every fall."
D) "The pneumococcal vaccine protects against bacterial pneumonia."
Answer: C
Explanation: A) Influenza vaccine should not be given to those with an allergy to eggs.
B) Influenza vaccine is administered annually to healthy individuals.
C) The pneumococcal vaccine is administered once. Revaccination is only recommended in persons with renal failure, those who have had splenectomies, those with malignancies, and those with HIV/AIDS.
D) Because the pneumococcal vaccine is made of antigens from 23 types of pneumococci, a type of bacteria, it only protects against bacterial pneumonias.
Page Ref: 665-666
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Compare the risk factors and prevention of pneumonia.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

6) Which intervention should the nurse carry out to manage fever in a client with pneumonia? **Select all that apply.**
A) Increase the temperature of the room environment to prevent shivering.
B) Administer antipyretic medications.
C) Restrict fluids during periods of hyperthermia because of the risk of electrolyte imbalance.
D) Use ice packs and a tepid bath every 2 hours.
E) Promote frequent rest periods to increase energy reserve.
Answer: B, E
Explanation: A) Increasing the room temperature would cause the client discomfort.
B) The nurse should administer antipyretic medications as indicated for elevated temperatures.
C) The nurse should encourage fluid intake rather than restrict fluids because of the risk of electrolyte imbalance.
D) The nurse should use ice packs, cool/tepid baths, or a hypothermia blanket with caution and only as needed.
E) The nurse should enforce frequent rest periods because rest increases energy reserve that is depleted by increased metabolic, heart, and respiratory rates.
Page Ref: 667
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with pneumonia.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

7) The nurse is caring for a client who develops a fever and productive cough after abdominal surgery. Which orders should the nurse expect from the healthcare provider? **Select all that apply.**
A) Sputum cultures
B) Antibiotics
C) Chest physiotherapy
D) Bronchial washing for culture
E) Isolation precautions
Answer: A, B, C
Explanation: A) The nurse would expect to obtain sputum cultures.
B) The nurse would expect to administer antibiotics.
C) The nurse would expect to perform chest physiotherapy to help clear the respiratory secretions.
D) Bronchial washings are not included in routine care for this situation.
E) Isolation precautions are usually not ordered for noncontagious infections.
Page Ref: 666
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with pneumonia.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

8) Which condition is *not* one of the four distinct patterns of pneumonia?
A) Lobar pneumonia
B) Bronchopneumonia
C) Alveolar pneumonia
D) Interstitial pneumonia
Answer: C
Explanation: A) The four distinct patterns of pneumonia include lobar pneumonia.
B) The four distinct patterns of pneumonia include bronchopneumonia.
C) Alveolar pneumonia is not a typical pattern for pneumonia.
D) The four distinct patterns of pneumonia include interstitial pneumonia.

Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Describe the pathophysiology of pneumonia.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

9) Which type of pneumonia rarely occurs in individuals with normal immune function?
A) Pneumonia caused by the influenza virus

B) Pneumonia caused by *Pneumocystis jiroveci*
C) Pneumonia caused by *Mycoplasma pneumoniae*
D) Pneumonia caused by *Streptococcus pneumoniae*
Answer: B
Explanation: A) The influenza virus is a common cause of pneumonia in the general population.
B) Individuals who are significantly immunocompromised are at significant risk of developing pneumonia caused by *Pneumocystis jiroveci*. Immunity to *P. jiroveci* is nearly universal, except in those who are immunocompromised.
C) *Mycoplasma pneumoniae* is a common cause of pneumonia in the general population.
D) *Streptococcus pneumoniae* is a common cause of pneumonia in the general population.

Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Describe the etiology of pneumonia.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

10) The provider has ordered fluid administration for a pediatric client with pneumonia. The client weighs 81.6 lb (37 kg). The nurse should expect to administer ________ mL of fluid per day for this client.
Answer: 1840
Explanation: Administer 100 mL/kg/day for the first 10 kg, 50 mL/kg/day for the second 10 kg, and 20 mL/kg/day for all additional body weight over 20 kg. Therefore, this client should receive (10 kg × 100 mL) + (10 kg × 50 mL) + (17 kg × 20 mL) = 1000 mL + 500 mL + 340 mL = 1840 mL/day.

Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Differentiate care of patients with pneumonia across the lifespan.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

11) For which reason should adequate hydration be maintained in a client with pneumonia?
A) It helps maintain urine output to clear toxins from the blood.
B) It helps increase blood pressure to maintain perfusion to vital organs.
C) It helps keep the mucus membranes moist to prevent further infection.
D) It helps keep the airway clear by making secretions easier to expectorate.

WwW.TpSy.Vg

Answer: D
Explanation: A) For the client with pneumonia, adequate hydration is not done to clear toxins from the blood.
B) Adequate hydration is not maintained to support blood pressure in the client with pneumonia.
C) Adequate hydration is not maintained to prevent further infection in a client with pneumonia.
D) For clients with pneumonia, the most important reason to maintain adequate hydration is that this helps keep secretions in the lungs thin, which makes them easier to expectorate. This helps keep the airway clear, which is a priority for clients with pneumonia.
Page Ref: 671
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 9.E. Analyze pneumonia as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with pneumonia.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with pneumonia.

Exemplar 9.F Sepsis

1) A client is admitted to the intensive care unit with a systemic infection. Which manifestations will the nurse most likely assess in this client? **Select all that apply.**
A) Tachycardia
B) Pain
C) Edema
D) Hypotension
E) Fever
Answer: A, D, E
Explanation: A) Tachycardia is a common symptom of a systemic infection.
B) Pain is a symptom of a local infection.
C) Edema is a symptom of a local infection.
D) Hypotension is a common symptom of a systemic infection.
E) Fever is a common symptom of a systemic infection.
Page Ref: 676
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.F. Analyze sepsis as it relates to infection. Identify the clinical manifestations of sepsis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

2) The nurse is providing teaching on preventing sepsis. Which finding should the nurse include as a major risk factor for the development of this health problem?
A) Pneumococcal bacteria
B) Leukocytosis on the complete blood count
C) Undiagnosed urinary tract infection
D) Elevated temperature
Answer: C
Explanation: A) Pneumococcal bacteria is not identified as a risk factor for the development of sepsis. Sepsis is most often the result of gram-positive infections from *Staphylococcus* and *Streptococcus* bacteria but may also follow gram-negative bacterial infections such as *Pseudomonas*, *Escherichia coli*, and *Klebsiella*.
B) Leukocytosis occurs with sepsis if the client is able to mount an immune response.
C) A portal of entry for sepsis is the urinary system.
D) An elevated temperature is a manifestation of sepsis.
Page Ref: 676
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.F. Analyze sepsis as it relates to infection. Describe the etiology of sepsis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

3) A 1-month-old infant is admitted to the hospital with a temperature of 102°F. For which reason should this infant be evaluated for sepsis?
A) Absence of sweat glands
B) Immature immune system
C) Inadequate red blood cells
D) Poor lung elasticity
Answer: B
Explanation: A) The child is not evaluated for sepsis because of the absence of sweat glands.
B) A child less than 3 months of age with a temperature higher than 100.4°F should be evaluated for sepsis because the child is at increased risk secondary to an immature immune system.
C) The child is not evaluated for sepsis because of inadequate red blood cells.
D) The child is not evaluated for sepsis because of poor lung elasticity.
Page Ref: 678
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 9.F. Analyze sepsis as it relates to infection. Differentiate care of patients with sepsis across the lifespan.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

4) The nurse is caring for a client with septicemia. Which assessment by the nurse best addresses the potential for inadequate peripheral tissue perfusion?
A) Monitor heart rate every hour.
B) Assess temperature every 4 hours.
C) Monitor pupil reactions every 8 hours.
D) Monitor for cyanosis.
Answer: D
Explanation: A) Heart rate is used to assess for cardiac output.
B) Temperature is assessed to determine the presence of an infection.
C) Pupil reaction is used to assess neurologic function.
D) A change in skin color will alert the nurse immediately of decreased tissue perfusion.
Page Ref: 679
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 9.F. Analyze sepsis as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with sepsis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

5) The nurse is caring for an older adult client who developed sepsis from a pressure ulcer while residing in a long-term care facility. The family asks how they can help prevent this from happening again in the future. Which response by the nurse is best?
A) Alert the staff when the client's IV runs dry.
B) Help the nurse with dressing changes.
C) Assist the client to the bathroom so there is not a fall.
D) Assist the client with meals to obtain optimal nourishment.
Answer: D
Explanation: A) The family is not responsible for IV monitoring.
B) The family is not responsible for dressing changes.
C) Assisting the client to the bathroom should be done by the staff who are responsible for client safety.
D) Poor nutritional status and a slow-functioning immune system contribute to the risk for sepsis in the older client. The family can help by assisting and encouraging the client to take in the proper nourishment needed.
Page Ref: 679
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Learning Outcome: 9.F. Analyze sepsis as it relates to infection. Differentiate care of patients with sepsis across the lifespan.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

W W . T B S M . N G

6) Which finding supports the nurse's evaluation that an older adult client with sepsis has maintained a normal mental status?
A) The client is agitated.
B) The client has a Glasgow coma score of 4.
C) The client responds to questions appropriately.
D) The client's pupils are fixed and dilated.
Answer: C
Explanation: A) Restlessness or agitation in a client with sepsis can be a sign that the client's condition is deteriorating.
B) The client with a Glasgow coma score of 4 is comatose.
C) A client who responds to questions appropriately is alert and oriented.
D) When pupils are fixed and do not respond to light, death is imminent.
Page Ref: 679

Learning Outcome: 9.F. Analyze sepsis as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with sepsis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

7) The nurse is admitting a client to the intensive care unit. Earlier, the client presented to the emergency department in early septic shock. Which assessment findings should the nurse anticipate? **Select all that apply.**
A) Normal blood pressure
B) Rapid and deep respirations
C) Shallow respirations
D) Warm and flushed skin
E) Lethargic mental status
F) Decreased urine output
Answer: A, B, D
Explanation: A) Septic shock has an early phase and a late phase. Early-phase manifestations include normal blood pressure.
B) Septic shock has an early phase and a late phase. Early-phase manifestations include rapid and deep respirations.
C) Shallow respirations occur in the late phase of shock.
D) Septic shock has an early phase and a late phase. Early-phase manifestations include warm or flushed skin.
E) Lethargy occurs in the late phase of shock.
F) Decreased urine output occurs in the late phase of shock.
Page Ref: 677

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 9.F. Analyze sepsis as it relates to infection. Identify the clinical manifestations of sepsis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

8) In which order should the nurse list the pathophysiology concepts that occur in the development of sepsis?
A) Macrophage-producing cytokines are released.
B) Endotoxin released by microorganisms sets off an out-of-control inflammatory process.
C) Neutrophils arrive and multiply, occluding capillaries.
D) Vasodilation with increased capillary permeability and fluid leak.
Answer: B, A, D, C
Explanation: The pathophysiology of sepsis occurs as follows: Endotoxin released by microorganisms sets off an out-of-control inflammatory process; macrophage-producing cytokines are released; vasodilation with increased capillary permeability and fluid leak; neutrophils arrive and multiply, occluding capillaries.
Page Ref: 676
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 9.F. Analyze sepsis as it relates to infection. Describe the pathophysiology of sepsis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

9) Which action should the nurse take to prevent sepsis in a hospitalized client?
A) Use aseptic techniques when inserting a catheter.
B) Place clients with infections in negative airflow rooms.
C) Use airborne precautions when assessing clients.
D) Teach proper techniques for using tampons.
Answer: A
Explanation: A) One risk factor for developing sepsis is not using aseptic techniques and good hand washing techniques when inserting a catheter. Following standard guidelines for using aseptic and hand washing techniques when inserting or removing a catheter can help prevent sepsis.
B) Not all clients who are at risk for sepsis need to be placed in a negative airflow room.
C) Not all clients who are at risk for sepsis require airborne precautions during assessment.
D) Teaching proper techniques for using tampons will help prevent sepsis, but this is more appropriate for clients in the community rather than hospitalized clients.
Page Ref: 676
Cognitive Level: Remembering
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: V.A.1. Learning Outcome: 9.F. Analyze sepsis as it relates to infection. Compare the risk factors and prevention of sepsis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

10) Which diagnostic test result is consistent with a diagnosis of septic shock?
A) A blood pH that is higher than normal
B) A hematocrit that is higher than normal
C) A $PaCO_2$ that is lower than normal
D) A potassium level that is lower than normal
Answer: B
Explanation: A) During septic shock, the blood pH will be lower than normal (indicating acidosis).
B) During septic shock, fluid leaks from the intravascular to the extravascular spaces, causing hemoglobin and hematocrit concentrations that are higher than normal.
C) During septic shock, the $PaCO_2$ will increase.
D) During septic shock, the potassium level will increase.
Page Ref: 678

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with sepsis.

Exemplar 9.G Tuberculosis

1) The nurse is preparing to assess an older adult client admitted with tuberculosis. Which assessment finding does the nurse anticipate?
A) Night sweats
B) Swollen lymph nodes
C) Cough
D) Hemoptysis
Answer: C
Explanation: A) Night sweats are more common in younger adults but are not considered presenting symptoms of tuberculosis in the older adult.
B) Swollen lymph nodes are more common in younger adults but are not considered presenting symptoms of tuberculosis in the older adult.
C) Presenting symptoms of tuberculosis in the older adult are often vague and include coughing, weight loss, diminished appetite, and periodic fevers.
D) Hemoptysis is more common in younger adults but is not considered a presenting symptom of tuberculosis in the older adult.

Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Differentiate care of patients with tuberculosis across the lifespan.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

2) An adolescent client is brought to the emergency department (ED) with fatigue, weight loss, a dry cough, and night sweats. The family just recently immigrated to the United States. Based on this data, which potential risk should the nurse include when planning care for this client?
A) Pneumothorax
B) Atelectasis
C) Renal failure
D) Reduced peristalsis
Answer: A
Explanation: A) This client was foreign-born, a risk factor for tuberculosis (TB), and has the classic symptoms of tuberculosis. The nurse plans frequent respiratory assessments, as this child is at risk for pneumothorax.
B) Clients with TB are not at particular risk for atelectasis.
C) Clients with TB are not at particular risk for renal failure.
D) Clients with TB are not at particular risk for reduced peristalsis.
Page Ref: 685
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Identify the clinical manifestations of tuberculosis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

3) The nurse is providing a health screening for a homeless client with a history of drug abuse. The client has a chronic, nonproductive cough. For which should the nurse expect to screen this client?
A) Herpes zoster
B) Sickle cell disease
C) Sick sinus syndrome
D) Tuberculosis
Answer: D
Explanation: A) There is no evidence to support the need to screen the client for herpes zoster.
B) There is no evidence to support the need to screen the client for sickle cell disease.
C) There is no evidence to support the need to screen the client for sick sinus syndrome.
D) The homeless client who abuses drugs is at risk for contracting tuberculosis (TB); therefore, the nurse would expect to screen this client for TB.
Page Ref: 683
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Compare the risk factors and prevention of tuberculosis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

4) The nurse is planning care for a client recently diagnosed with tuberculosis (TB). The client lives alone in an apartment and will continue treatment at home. When reviewing the client's history, the nurse notes that the client has had trouble complying with medication regimens in the past. Which problem is a priority for this client?

A) Inadequate health maintenance skills
B) Lack of knowledge about TB
C) Risk for infection
D) Poor community health

Answer: A

Explanation: A) The treatment regimen for tuberculosis requires that the client take many medications, maintain nutrition, and be aware of potential side effects. Given the complexity of this regimen and the client's history of noncompliance, the client is at risk for inadequate health maintenance skills.

B) The client may lack knowledge about TB but the priority is the health management.

C) The client has an infection.

D) There is no evidence that the client is at risk for poor community health.

Page Ref: 690-691

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Differentiate care of patients with tuberculosis across the lifespan.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

5) An occupational health nurse is screening a new employee in a long-term care facility for tuberculosis (TB). The employee questions why purified protein derivative (PPD) testing is done twice. Which response should the nurse make?
A) "Different medication is used in the second PPD."
B) "The treatment for TB is 6 months of medication, and we want to make sure the first results of the first PPD were accurate."
C) "The first PPD was not interpreted in the correct time frame of 48-72 hours."
D) "There is an increased risk for a false-negative response for people who work in long-term care facilities. The two-step process is recommended to accurately screen for TB."
Answer: D
Explanation: A) PPD testing is not done twice because different medication is used.
B) Treatment for TB for 6 months is not a reason to complete the PPD twice.
C) Evaluating the test at the wrong interval is not the reason that the PPD is done twice for long-term care facility employees.
D) PPD testing is done in a two-step process for people who work in long-term care facilities because of the risk of false-negative responses.
Page Ref: 690
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Compare the risk factors and prevention of tuberculosis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

6) The nurse has provided teaching on multidrug treatment to a client with tuberculosis. Which statement by the client indicates that the teaching was effective?
A) "Multiple drugs are necessary to develop immunity to tuberculosis."
B) "Multiple drugs are necessary because I became infected from an immigrant."
C) "Multiple drugs will be required as long as I am contagious."
D) "Multiple drugs are necessary because of the risk of resistance."
Answer: D
Explanation: A) Drugs to treat tuberculosis do not cause immunity to the disease.
B) There is no indication that the client contracted TB from an immigrant.
C) Treatment must be continued long after the client is no longer contagious.
D) Tuberculosis bacilli are likely to develop resistance to one drug, so multiple drugs must be used.
Page Ref: 686
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with tuberculosis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

7) The nurse is caring for a client who is admitted to the unit with tuberculosis (TB). Which type of isolation room is most appropriate?
A) Single-door room with positive airflow (air flows out of the room)
B) Isolation room with an anteroom and negative airflow (air flows into the room)
C) Isolation room with an anteroom and normal airflow
D) Single-door room with normal airflow
Answer: B
Explanation: A) Single-door rooms are not equipped to have positive or negative airflow.
B) Patients with airborne infections such as meningococcemia, severe acute respiratory syndrome (SARS), or TB are placed in an isolation room with an anteroom and negative pressure airflow. Air flows into the room and is vented in a special manner to prevent the organism from entering the rest of the unit.
C) Positive flow rooms are used for those clients who are immunosuppressed so that microorganisms from the unit are not drawn into the room.
D) Single-door isolation with normal airflow might be used for a client with droplet or wound infection.
Page Ref: 692
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with tuberculosis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

8) The charge nurse for a medical-surgical unit is notified that a client with tuberculosis (TB) is being transported to the unit. Which actions for infection prevention are the most appropriate in this circumstance? **Select all that apply.**
A) Stock the client's supply cart at the beginning of each shift.
B) Wear a respirator and gown when caring for the client.
C) Have the client wear a mask when coming from admissions.
D) Perform hand hygiene only after leaving the room.
E) Test all staff members for TB immediately.
Answer: B, C
Explanation: A) Supplies to prevent transmission of disease should be stocked at the end of the shift so that adequate supplies will be available for the next healthcare provider.
B) HEPA-filtered respirators and gowns should be worn when caring for clients who do not reliably cover their mouths when coughing.
C) When a client has an airborne disease and must go elsewhere in the hospital, the client must wear a mask.
D) Hand hygiene should be performed before and after client care.
E) Clinical staff receive TB testing annually. There is no reason to test all staff members at this time.
Page Ref: 692
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 5.3 Contribute to a culture of provider and work environment safety. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with tuberculosis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

9) The nurse is caring for a client with tuberculosis (TB) who is taking rifampin for treatment of the disease. Which nursing interventions are appropriate for this client? **Select all that apply.**
A) Administer the medication with meals to reduce gastrointestinal side effects.
B) Record a baseline visual examination before initiating therapy.
C) Administer the medication on an empty stomach.
D) Administer the medication by deep intramuscular injection into a large muscle mass.
E) Monitor complete blood count (CBC), liver function studies, and renal function studies for evidence of toxicity.
Answer: C, E
Explanation: A) Rifampin is taken on an empty stomach.
B) A baseline visual examination before therapy is necessary with ethambutol, another antituberculosis medication.
C) Rifampin should be administered on an empty stomach.
D) Rifampin is an oral antituberculosis medication.
E) The nurse should monitor the CBC, liver function studies, and renal function studies.
Page Ref: 688, 692
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with tuberculosis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

10) The nurse caring for a client at risk for tuberculosis (TB) should include which symptoms of the disease when educating the client? **Select all that apply.**
A) Fatigue
B) Low-grade morning fever
C) Productive cough that later turns to a dry, hacking cough
D) Weight loss
E) Night sweats
Answer: A, D, E
Explanation: A) Manifestations of tuberculosis often develop insidiously and are initially nonspecific. Fatigue is common.
B) Manifestations of tuberculosis include a low-grade fever in the afternoon.
C) A dry cough develops, which later becomes productive of purulent and/or blood-tinged sputum.
D) Manifestations of tuberculosis include weight loss.
E) Manifestations of tuberculosis include night sweats.
Page Ref: 685
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Identify the clinical manifestations of tuberculosis.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

11) A client with a previously healed tuberculosis lesion experiences lesion rupture that leads to active disease. Which type of tuberculosis does this client have?
A) Miliary tuberculosis
B) Extrapulmonary tuberculosis
C) Reactivation tuberculosis
D) Cavitation tuberculosis
Answer: C
Explanation: A) Miliary tuberculosis is the spread of tuberculosis through the blood to the rest of the body.
B) Extrapulmonary tuberculosis is tuberculosis outside of the lungs.
C) When a previously healed tuberculosis lesion ruptures and initiates active disease, this is called reactivation tuberculosis.
D) Cavitation is a process by which a bubble or cavity is formed from tuberculosis infection. It is not a type of tuberculosis.
Page Ref: 682
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Describe the pathophysiology of tuberculosis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

12) A client asks what caused the disease tuberculosis (TB). Which organism should the nurse respond is causing the condition?
A) *Micrococcus tuberculosis.*
B) *Microbacterium tuberculosis*.
C) *Mycoplasma tuberculosis*.
D) *Mycobacterium tuberculosis*.
Answer: D
Explanation: A) *Micrococcus tuberculosis* is another form of bacteria but does not cause tuberculosis.
B) *Microbacterium tuberculosis* is another form of bacteria but does not cause tuberculosis.
C) *Mycoplasma* tuberculosis is another form of bacteria but does not cause tuberculosis.
D) Tuberculosis is caused by the bacterium *Mycobacterium tuberculosis*.

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.G. Analyze tuberculosis as it relates to infection. Describe the etiology of tuberculosis.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with tuberculosis.

Exemplar 9.H Urinary Tract Infection

1) An adult client is admitted to the hospital with a diagnosis of kidney stones. The healthcare provider prescribes IV fluids, x-rays, blood work, and an indwelling urinary catheter for the client. The nurse is caring for the client 3 days after admission and documents morning vital signs of 101°F, heart rate 92, respirations 25, and blood pressure 120/80. The urinary output has decreased, and the urine is cloudy and dark amber. Based on this data, which conclusion by the nurse is the most appropriate?
A) The client has passed the kidney stones.
B) The client is in acute renal failure.
C) The client has developed a respiratory infection.
D) The client has a probable urinary tract infection.
Answer: D
Explanation: A) There is no evidence the client passed the kidney stones.
B) There is no evidence the client is in renal failure.
C) There is no evidence of a respiratory infection.
D) The client has developed a urinary tract infection that was not present upon admission. This is a healthcare-associated infection (HAI) and is likely due to poor technique when inserting the indwelling urinary catheter.
Page Ref: 696, 698
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Identify the clinical manifestations of urinary tract infections.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

WW.TESTBANKS

2) The nurse for a urology clinic is planning an in-service about urinary infections for a group of novice nurses. Which statement should the nurse include in the presentation?
A) Men are most likely to experience descending urinary tract infections.
B) Straight catheterization is the only way to evaluate for the presence of a urinary tract infection.
C) Women require a shorter course of antibiotic therapy to manage a urinary tract infection than men.
D) The rate of urinary tract infections is similar between men and women.
Answer: C
Explanation: A) Descending infections are less common than ascending infections of the urinary tract.
B) A clean-catch midstream specimen is a reliable means to obtain a urine specimen to check for the presence of infection.
C) Men will usually be prescribed a longer course of therapy to manage a urinary tract infection. They have a longer urethra and typically experience more complicated urinary tract infections than women.
D) Women have a higher rate of urinary tract infection than men.
Page Ref: 700
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with urinary tract infection.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

3) The nurse is providing teaching to the family of an older adult client with a urinary tract infection (UTI). Which common early symptom that is likely to occur in older adults should the nurse stress?
A) Urinary urgency
B) Blood in the urine
C) Urinary frequency
D) Alteration in cognition
Answer: D
Explanation: A) Urinary urgency is not a common early symptom of a UTI in an older adult.
B) Blood in the urine is not a common early symptom of a UTI in an older adult.
C) Urinary frequency is not a common early symptom of UTI in an older adult.
D) Older adult clients are often asymptomatic until changes in cognition occur.
Page Ref: 701
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Differentiate care of patients with urinary tract infection across the lifespan.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

4) Which question best helps the nurse establish a common cause of recurrent urinary tract infections (UTIs) in a preadolescent female client?
A) "When was your last UTI?"
B) "How often do you shower?"
C) "Do you have a family history of urinary problems?"
D) "In what direction do you wipe after a bowel movement?"
Answer: D
Explanation: A) The nurse would have the information about the client's last UTI.
B) Personal hygiene practices, such as cleansing after a bowel movement, are a priority teaching instruction to include for this client.
C) Urinary tract infections are not associated with families or genetics.
D) The most important teaching to provide females is always to wipe the perianal/genital area from front to back. *Escherichia coli* are the most common microorganisms responsible for urinary tract infections and can easily be dragged into the urethral orifice by wiping from the anus to the urethra after defecation. Females do have a shorter urethra compared with males and are more susceptible to urinary tract infections for this reason.
Page Ref: 697
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Compare the risk factors and prevention of urinary tract infections.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

5) The nurse is providing teaching to parents about urinary tract infections (UTIs) in preschool children. The nurse should inform the parents that which symptoms of UTI are common in this age group? **Select all that apply.**
A) Urinary urgency
B) Elevated blood pressure
C) Dysuria
D) Fever
E) Headache
Answer: A, C, D
Explanation: A) Clinical manifestations of a UTI in a preschool-aged child includes urgency.
B) Elevated blood pressure is not a clinical manifestation of a UTI in a preschool-aged child.
C) Clinical manifestations of a UTI in a preschool-aged child includes dysuria.
D) Clinical manifestations of a UTI in a preschool-aged child includes a fever.
E) Headache is not a clinical manifestation of a UTI in a preschool-aged child.
Page Ref: 700
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Identify the clinical manifestations of urinary tract infections.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

6) The nurse is providing discharge teaching for a client diagnosed with a urinary tract infection (UTI). The client is prescribed a 3-day course of oral trimethoprim-sulfamethoxazole (TMP-SMZ). Which client statement indicates that teaching has been effective?
A) "I will return within 10 days for a follow-up urine culture."
B) "I will practice Kegel exercises on a daily basis."
C) "I will increase my intake of fluids, especially citrus juice."
D) "I will only wear 100% cotton underwear."
Answer: A
Explanation: A) It is essential to validate eradication of infection with a follow-up culture that is negative.
B) Doing Kegel exercises does not evaluate the effectiveness of teaching about the treatment for a UTI.
C) Citrus juices are not recommended because they irritate the bladder and have no effect on urine acidity.
D) Wearing cotton underwear is a prevention measure; however, it does not evaluate the effectiveness of teaching about the treatment for a UTI.
Page Ref: 699-700
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Apply the nursing process in providing culturally competent care to an individual with a urinary tract infection.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

7) The healthcare provider prescribes an indwelling urinary catheter for a client with urinary retention. Which intervention, along with strict aseptic technique, will decrease the risk of infection for this procedure?
A) Irrigating the catheter with sterile saline on a daily basis
B) Instructing the client to void around the catheter
C) Inserting the catheter to the full recommended length
D) Inflating the balloon while the catheter is in the urethra
Answer: C
Explanation: A) Irrigating the catheter should not be done because it can introduce infection by allowing bacteria to enter the closed urinary drainage system.
B) Although voiding around the catheter will decrease bladder spasms, it will not help reduce infection.
C) An action to prevent infection with an indwelling urinary catheter is to insert it to the full recommended length before inflating the balloon.
D) The balloon is not inflated until the catheter is in the bladder, in order to prevent trauma to the urethra and therefore decrease the risk of infection.
Page Ref: 703
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Compare the risk factors and prevention of urinary tract infections.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

8) The nurse in an urgent care center assesses a 40-year-old adult client who presents with a fever of 101.2°F and complaints of painful urination. Which question should the nurse ask to elicit further data that indicate cystitis?
A) "Do you have any symptoms of menopause?"
B) "How long have you had a fever, and have you had chills with this?"
C) "Do you have any upper abdominal pain or cramping?"
D) "What color is your urine?"
Answer: D
Explanation: A) A 40-year-old client who presents with a fever and painful urination is not experiencing symptoms of menopause.
B) Asking about fever and chills is not specific to suspected cystitis and does not elicit information related to urinary symptoms.
C) Pain from cystitis is typically suprapubic, not upper abdominal.
D) The classic symptoms of cystitis include dysuria or painful urination, urinary frequency and urgency, and bloody urine or hematuria.
Page Ref: 696
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Identify the clinical manifestations of urinary tract infections.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

9) The nurse is creating a teaching tool about urinary tract infections. Which type of infection should the nurse explain about that results from bacteria ascending to the kidney from the lower urinary tract?
A) Urethritis
B) Prostatitis
C) Pyelonephritis
D) Cystitis
Answer: C
Explanation: A) Urethritis is a lower urinary tract infection.
B) Prostatitis is a lower urinary tract infection.
C) Pyelonephritis is inflammation of the renal pelvis and parenchyma. This is the most common upper urinary tract infection.
D) Cystitis is a lower urinary tract infection.
Page Ref: 696
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Describe the pathophysiology of urinary tract infections.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

10) Which source of bacteria should the nurse explain as being the most common for the development of a urinary tract infection (UTI)?
A) An indwelling urinary catheter
B) Mucous membranes of the perineal area
C) The hands
D) Clothing such as underwear
Answer: B
Explanation: A) The presence of an indwelling urinary catheter is a risk factor for development of a UTI, but the source of bacteria is not the catheter itself.
B) Pathogens usually enter the urinary tract by ascending from the mucous membranes of the perineal area into the lower urinary tract. The source of bacteria is still often the mucous membranes of the perineal tract.
C) The hands are potential sources of bacteria that cause a UTI, but they are not the most common.
D) Clothing is a potential source of bacteria that cause a UTI, but is not the most common.
Page Ref: 696
Cognitive Level: Understanding
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Describe the etiology of urinary tract infections.

MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

11) The nurse is caring for a 6-year-old client with a urinary tract infection (UTI). Which nursing outcome is appropriate for this client?
A) Bilirubin levels will remain within normal limits.
B) No episodes of enuresis.
C) Remain afebrile for 12 hours prior to discharge.
D) Void at least 300 mL of urine over 24 hr.
Answer: B
Explanation: A) An outcome related to bilirubin levels would be more appropriate for a neonate, not a school-aged child.
B) Children who are potty trained often develop enuresis, or involuntary passage of urine, during a urinary tract infection. An appropriate nursing outcome would be that the child would recover enough from the infection that the child no longer experiences enuresis.
C) The client should be afebrile for 24 hours prior to discharge, not 12 hours.

D) The client should be voiding 500 to 1000 mL of urine in 24 hours, depending on weight. Only voiding 300 mL of urine would be cause for concern.
Page Ref: 700
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 9.H. Analyze urinary tract infection as it relates to infection. Differentiate care of patients with urinary tract infection across the lifespan.
MNL LO: Demonstrate understanding of the concept of infection in the care of a patient with urinary tract infection.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e (Pearson)
Module 10 Inflammation

The Concept of Inflammation

1) The nurse is caring for a client who has experienced a sports-related injury to the knee. During the morning assessment, which signs of inflammation should the nurse anticipate? **Select all that apply.**
A) Pitting edema
B) Pallor
C) Swelling
D) Warmth
E) Pain
Answer: C, D, E
Explanation: A) Pitting edema is not a sign of inflammation.
B) Pallor is not a sign of inflammation.
C) Swelling is a sign of inflammation.
D) Warmth is a sign of inflammation.
E) Pain is a sign of inflammation.
Page Ref: 710
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.1. Analyze the physiology of inflammation in the body.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

2) A client is admitted to the hospital with airway edema, bronchoconstriction, and increased mucus production after being exposed to an allergen. Which nursing interventions are appropriate to address this inflammation to the client's respiratory system? **Select all that apply.**

A) Turn and reposition every 2 hours
B) Monitor oxygen saturation
C) Administer oxygen as prescribed
D) Restrict fluids
E) Monitor lung sounds

Answer: B, C, E

Explanation: A) Turning and repositioning every 2 hours would be appropriate to maintain tissue integrity but not to address respiratory inflammation.

B) Monitoring oxygen saturation would be appropriate care for a client who is experiencing inflammation of the respiratory system.

C) Administering oxygen would be appropriate care for a client who is experiencing inflammation of the respiratory system.

D) Restricting fluids could cause respiratory secretions to thicken and hinder the client's ability to maintain a clear airway. Fluids should be encouraged.

E) Monitoring lung sounds would be appropriate care for a client who is experiencing inflammation of the respiratory system.

Page Ref: 714
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.3. Outline the relationship between inflammation and other concepts.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

3) The nurse is providing instructions to a client who has been prescribed a nonsteroidal anti-inflammatory drug (NSAID). Which information is highest priority for the nurse to explain to the client about this medication?
A) "Take your medication on an empty stomach."
B) "Take with your morning aspirin dose."
C) "Constipation is common with your medication, so include roughage in your diet."
D) "Take your medication with food."
Answer: D
Explanation: A) Taking NSAIDs on an empty stomach can precipitate gastric irritation.
B) Nonsteroidal anti-inflammatory drugs (NSAIDs) can precipitate bleeding if taken with an anticoagulant such as aspirin.
C) Constipation is not an issue with NSAIDs.
D) Taking NSAIDs with food is recommended because doing so will decrease gastrointestinal (GI) irritation.
Page Ref: 720
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.7. Summarize collaborative therapies used by interprofessional teams for patients with inflammation.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

WwW.TbSm.Wg

4) The nurse is caring for a client with severe inflammation. Which assessment findings would indicate a systemic reaction to inflammation? **Select all that apply.**
A) Erythema
B) Edema
C) Pain
D) Tachypnea
E) Tachycardia
Answer: D, E
Explanation: A) Erythema is a local reaction to inflammation.
B) Edema is a local reaction to inflammation.
C) Pain is a local reaction to inflammation.
D) Systemic manifestations of infection include tachypnea.
E) Systemic manifestations of infection include tachycardia.
Page Ref: 717
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.5. Differentiate common assessment procedures and tests used to examine inflammation.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

5) The nurse in a rheumatology clinic is managing care for clients who receive nonsteroidal anti-inflammatory drugs (NSAIDs) for the treatment of their disease processes. Which primary laboratory tests should the nurse assess prior to initiation of NSAID therapy? **Select all that apply.**

A) Serum amylase

B) Electrolytes

C) Hemoglobin

D) White blood cell count (WBC)

E) Liver function tests

Answer: D, E

Explanation: A) There is no need to assess the client's serum amylase before giving NSAIDs.

B) There is no need to assess the client's electrolytes before giving NSAIDs.

C) There is no need to assess the client's hemoglobin before giving an NSAID.

D) It is important to assess the client's WBC count to determine the presence of an infection which could be masked by the effects of the NSAID.

E) It is important to assess the client's liver function test prior to beginning NSAID therapy.

Page Ref: 717

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 10.7. Summarize collaborative therapies used by interprofessional teams for patients with inflammation.

MNL LO: Analyze the concept of inflammation and its application to nursing care.

6) The nurse is providing care to a client who experiences chronic inflammation due to arthritis. For which collaborative intervention should the nurse plan when providing care to this client?
A) Administering anti-inflammatory medications
B) Administering diuretics
C) Administering frequent doses of opioid medications
D) Administering antibiotics
Answer: A
Explanation: A) Anti-inflammatory medication will reduce the pain and inflammation caused by arthritis.
B) Diuretics are not used to treat the inflammatory process.
C) Opioid medication is not usually indicated to treat a chronic inflammatory process.
D) Antibiotics would be ordered for an infection, not for chronic inflammation.
Page Ref: 718
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 10.7. Summarize collaborative therapies used by interprofessional teams for patients with inflammation.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

WwW.TbSm.Wg

7) The nurse is caring for a client who has extensive deep tissue damage. The nurse notes that the client is also vegan. Which dietary information should the nurse teach this client to enhance the healing process?
A) "A low-fat, high-carbohydrate, low-protein diet is best for healing."
B) "A high-fat, low-carbohydrate diet is best for healing."
C) "A high-carbohydrate, high-protein diet is best for healing."
D) "A diet high in protein and vitamin D is best for healing."
Answer: C
Explanation: A) Carbohydrates are important to meet the energy demands of healing, and protein is needed for cell growth. This client needs to be taught to eat proteins that provide the essential amino acids that can be lacking in a vegan diet. Fats are needed in moderation for the development of cell membranes.
B) Carbohydrates are important to meet the energy demands of healing, and protein is needed for cell growth. This client needs to be taught to eat proteins that provide the essential amino acids that can be lacking in a vegan diet. Fats are needed in moderation for the development of cell membranes.
C) Carbohydrates are important to meet the energy demands of healing, and protein is needed for cell growth. This client needs to be taught to eat proteins that provide the essential amino acids that can be lacking in a vegan diet.
D) Protein is needed for cell growth. Vitamins necessary to promote healing are C, K, A, and the B-complex vitamins.
Page Ref: 718
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 10.6. Analyze independent interventions nurses can implement for patients with inflammation.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

8) The nurse instructs an older adult client with arthritis on the side effects of nonsteroidal anti-inflammatory drug (NSAID) therapy. Which client statement would indicate that this teaching has been effective?

A) "I will report any abnormal bruising."

B) "Caffeine decreases the effectiveness of the medication."

C) "I cannot take other medications while using NSAIDs."

D) "If I notice a change in my mood after starting NSAID therapy, I will call the prescriber."

Answer: A

Explanation: A) Older adult clients are at risk for increased bleeding with NSAID therapy. Thus, the client should be taught to report any abnormal bruising, which may indicate bleeding.

B) There is no reason for avoiding caffeine while using an NSAID.

C) Older adult clients often take several medications, and refraining from taking them with NSAIDs is an unrealistic outcome.

D) Mood changes are not a side effect of NSAID therapy.

Page Ref: 720

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

Learning Outcome: 10.8. Differentiate considerations related to the assessment and care of patients with inflammation throughout the lifespan.

MNL LO: Analyze the concept of inflammation and its application to nursing care.

9) The warmth and redness that accompany inflammation result from which step in the inflammatory process?
A) Exudate production
B) Cellular regeneration
C) Hyperemia
D) Margination of leukocytes
Answer: C
Explanation: A) Exudate production occurs later in the inflammatory process and involves the release of fluid, dead cells, and cellular products from the injured area.
B) Cellular regeneration occurs during the last stage of the inflammatory process and does not cause redness or warmth.
C) Immediately after injury or infection, the damaged tissues release histamines, kinins, and prostaglandins. These substances serve as chemical mediators to dilate blood vessels, causing more blood to flow to the injured area. This increase in blood supply is called hyperemia and is responsible for the characteristic signs of redness and heat that accompany inflammation.
D) Margination refers to the process by which leukocytes aggregate along the inner surface of blood vessels in an injured area.
Page Ref: 710
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.1. Analyze the physiology of inflammation in the body.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

10) In the presence of inflammation, a client's erythrocyte sedimentation rate (ESR)
A) decreases due to the decreased proportion of fibrinogen in the blood.
B) decreases due to the increased proportion of fibrinogen in the blood.
C) increases due to the decreased proportion of fibrinogen in the blood.
D) increases due to the increased proportion of fibrinogen in the blood.
Answer: D
Explanation: A) The ESR level will not decrease when inflammation is present.
B) The ESR level will not decrease when inflammation is present.
C) The ESR level will not increase because of a decrease in the proportion of fibrinogen in the blood.
D) When an inflammatory process is active, the increased proportion of fibrinogen in a client's blood causes the red blood cells to stick to one another and settle faster. This, in turn, results in a higher ESR reading.
Page Ref: 717
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.5. Differentiate common assessment procedures and tests used to examine inflammation.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

11) The nurse is providing instruction to the parents of a pediatric client who is experiencing inflammation due to respiratory infection. Which point would be most appropriate for the nurse to include as part of this teaching?
A) "Try to keep your child in a supine position to promote more effective oxygenation."
B) "Adequate fluid intake is even more important for children with inflammation than for adults with inflammation."
C) "If your child seems to be gasping for air, encourage him to tuck his chin against his chest."
D) "Rapid heartbeat is an early sign of dehydration and low blood volume in children."
Answer: B
Explanation: A) As compared to adults, children have a larger tongue relative to the oral cavity, decreased airway muscle tone, a shorter epiglottis, a more anteriorly positioned larynx, a shorter and narrower trachea, and prominent adenoid and lymphoid tissue. These factors increase a child's risk of airway obstruction, especially when the child is supine.
B) Because of children's small size, absolute volumes of fluid loss represent a larger proportion of total body fluid. For this reason, adequate fluid intake is especially important for pediatric clients with inflammation.
C) As compared to adults, children have a larger tongue relative to the oral cavity, decreased airway muscle tone, a shorter epiglottis, a more anteriorly positioned larynx, a shorter and narrower trachea, and prominent adenoid and lymphoid tissue. These factors increase a child's risk of airway obstruction, especially when the neck is hyperflexed.
D) Tachycardia is frequently a late symptom of hypovolemia in children.
Page Ref: 721
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.8. Differentiate considerations related to the assessment and care of patients with inflammation throughout the lifespan.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

12) The nurse is teaching the family of a school-age client diagnosed with inflammatory bowel disease regarding the administration of prednisone at home. At which time should the nurse instruct the parents to provide this medication to the client?
A) 1 hour before meals
B) At bedtime
C) With meals
D) Between meals
Answer: C
Explanation: A) It should not be given on an empty stomach.
B) It should not be given at bedtime.
C) Prednisone, a corticosteroid, can cause gastric irritation. It should be administered with meals to reduce this irritation.
D) It should not be given on an empty stomach.
Page Ref: 719
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.7. Summarize collaborative therapies used by interprofessional teams for patients with inflammation.
MNL LO: Analyze the concept of inflammation and its application to nursing care.

Exemplar 10.A Appendicitis

1) A client is admitted to the hospital with an elevated temperature, nausea, and pain and tenderness in the lower right quadrant of the abdomen. After receiving pain medication, the client continues to complain of pain at a level of 8 on a 0-10 pain scale. The client is not scheduled to receive pain medications for at least another 2 hours. Given these circumstances, which statement by the nurse is most appropriate?
A) "I will inform the healthcare provider about your continued pain."
B) "I do not have any medications ordered for you at this time."
C) "Try to rest for a while longer until it is time to receive your medication."
D) "Let's try a heating pad or warm blanket to see if that helps with your discomfort."
Answer: A
Explanation: A) The client's inability to achieve comfort will need to be reported to the physician. The reported manifestations are consistent with appendicitis, so the client is at risk for perforation, which is manifested by increased pain.
B) Advising the client that no medications are available at this time does not meet the concerns being presented by the client.
C) Advising the client to rest does not meet the concerns being presented by the client.
D) The use of heat to manage the pain is contraindicated due to the risk of perforation.
Page Ref: 723
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with appendicitis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

WwW.TeSM.Ws

2) A client with acute abdominal pain is scheduled for an appendectomy in 3 hours. While waiting for the surgery, the client reports that the pain has subsided. Which action should the nurse take?

A) Determine when the client can be medicated for pain
B) Contact the surgery department
C) Contact the healthcare provider
D) Notify the nursing supervisor

Answer: C

Explanation: A) The next time the client can be medicated for pain is not relevant in this situation.

B) Notification of the surgery department should not be completed before contacting the healthcare provider.

C) The pain relief being experienced by the client is consistent with rupture of the appendix. In the case of suspected rupture, the healthcare provider should be notified immediately, because if the appendix has ruptured, the client's risk for peritonitis will increase.

D) Notification of the nursing supervisor should not be completed before contacting the healthcare provider.

Page Ref: 726

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Identify the clinical manifestations of appendicitis.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

3) An adult female client develops signs and symptoms of appendicitis during the night. The client is brought to the emergency department by her family. Which nursing intervention is the most culturally sensitive for this client?
A) Ask the healthcare provider who should assess the client.
B) Ask for a female healthcare provider to assess the client.
C) Ask for a male healthcare provider to assess the client.
D) Explain the assessment procedure and ask the client and family their preference.
Answer: D
Explanation: A) Asking the healthcare provider to decide who assesses the client does not take into account the client's wishes.
B) The nurse should not assume that a client will want a female healthcare provider.
C) The nurse should not assume that a client will want a male healthcare provider.
D) Culturally competent care means collaborating with the client to determine their preferences for medical care.
Page Ref: 725
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with appendicitis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

4) The nurse is caring for a pediatric client recovering from surgery for a perforated appendix. Which problem should the nurse use to guide this client's care during the immediate postoperative period?
A) Chronic pain
B) Fear
C) Potential for fluid volume deficit
D) Risk for infection
Answer: D
Explanation: A) Because the client is recovering from an appendectomy, the client will most likely have acute pain.
B) There is no evidence to suggest the client is afraid since the surgery has already occurred.
C) There is no evidence to suggest the client is at risk for deficient fluid volume.
D) Because the appendix ruptured before surgery, the client is at risk for infection, specifically peritonitis.
Page Ref: 725
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with appendicitis.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

5) The nurse, caring for an older school-age client recovering from an appendectomy, is preparing to help the family ambulate the child for the first time after surgery. Which nonpharmacologic nursing strategy would be most appropriate for this client?
A) Placing a warm, moist pack over the site of the incision
B) Holding a splint pillow against the abdomen when moving or coughing
C) Administering appropriate narcotic analgesics
D) Applying an ice pack over the site of the incision
Answer: B
Explanation: A) A splint pillow placed on the abdomen is a nonpharmacologic strategy to decrease discomfort after an appendectomy. Heat is not used on the incision area, as it can impair the healing process of the wound.
B) A splint pillow placed on the abdomen is a nonpharmacologic strategy to decrease discomfort after an appendectomy.
C) Administering a narcotic is considered a pharmacologic nursing strategy.
D) Ice is not used on the incision area, as it can impair the healing process of the wound.
Page Ref: 726
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with appendicitis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

6) A client with appendicitis is highly agitated and reports a great deal of pain. Which intervention will help decrease this client's anxiety?
A) Assess pain levels every 2 hours and administer ordered medication.
B) Provide reading material to help distract the client.
C) Distract the client with ambulation.
D) Administer pain medications when the client complains of pain.
Answer: A
Explanation: A) The extreme pain caused by appendicitis is the source of the client's anxiety. Assessing the client's pain level every 2 hours and administering medications before the pain gets intense is the best intervention to help decrease the client's anxiety.
B) Distraction does not work when clients have severe pain but is often appropriate for those with chronic pain.
C) Distraction does not work when clients have severe pain but is often appropriate for those with chronic pain.
D) Waiting until the client complains of pain makes pain relief more difficult and increases anxiety.
Page Ref: 726
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. WwW.TeSm.Us

7) The nurse is caring for a client in the emergency department who is suspected of having appendicitis. Which orders should the nurse anticipate from the healthcare provider? **Select all that apply.**
A) A cephalosporin antibiotic
B) A barium enema
C) Regular diet
D) Pain medication
E) Complete white blood cell count
Answer: A, D, E
Explanation: A) A cephalosporin, a third-generation antibiotic is the antibiotics of choice for appendicitis. The client should take nothing by mouth, so a regular diet is contraindicated.
B) A barium enema would not be ordered, as this could cause perforation of the appendix and bowel.
C) The client should take nothing by mouth, so a regular diet is contraindicated.
D) Pain medications will be ordered.
E) The provider will order a complete white blood cell count, which will be elevated if the client has appendicitis.
Page Ref: 723-724
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
www.TestBankSM.ws
Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with appendicitis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

8) The nurse is conducting an assessment on a client who is 36 hours postoperative following an appendectomy. During the assessment, the nurse is unable to hear any bowel sounds. The client denies passing flatus. Which action should the nurse take?
A) Assist with ambulation.
B) Encourage the client to increase oral fluid intake to promote peristalsis.
C) Encourage the client to increase solid food intake to promote peristalsis.
D) Encourage the client to decrease the amount of oral food and fluid intake.
Answer: A
Explanation: A) After abdominal surgery, the risk of a paralytic ileus exists. An ileus results when the bowel is not experiencing peristalsis. Ambulation can help expel intestinal gas and aid in the return of normal peristalsis.
B) Oral fluids will not promote peristalsis.
C) Eating will not promote peristalsis.
D) The client is likely to be taking nothing by mouth so reducing the amount of food and oral fluids would not be applicable.

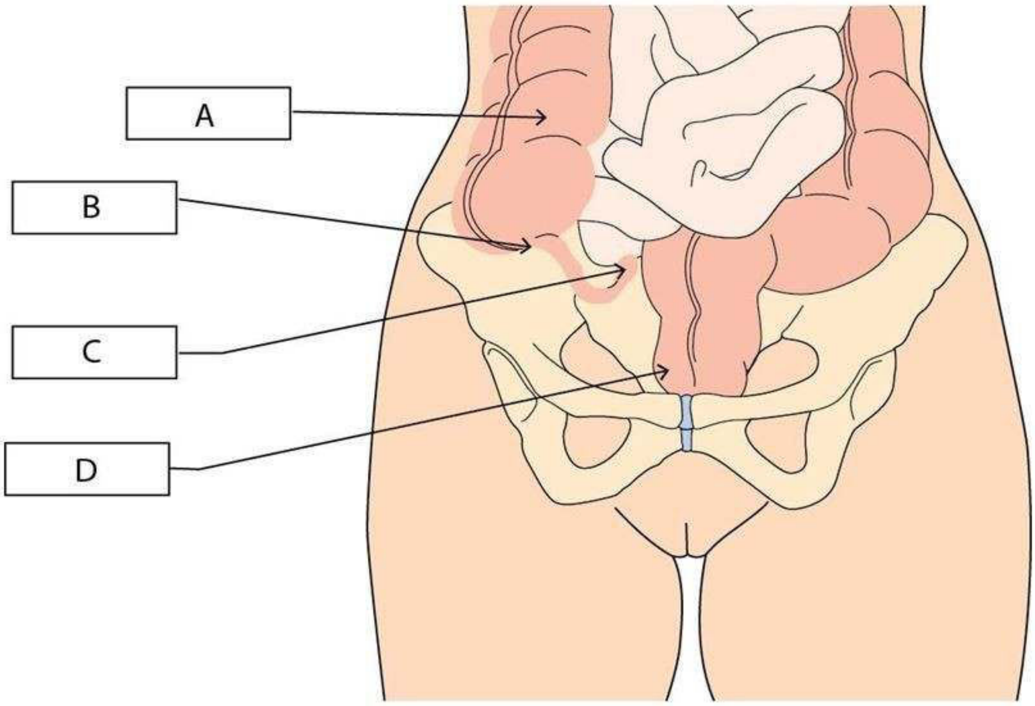
Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with appendicitis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

9)



The nurse checking for tenderness at McBurney point for a client with suspected appendicitis will palpate which area?

A) A
B) B
C) C
D) D
Answer: B
Explanation: A) McBurney point is not located near the liver.
B) McBurney point, located midway between the umbilicus and the anterior iliac crest in the right lower quadrant, is the usual site for localized pain and rebound tenderness due to appendicitis.
C) McBurney point is not located at the site of the appendix.
D) McBurney point is not located at the site of the rectum.

Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Identify the clinical manifestations of appendicitis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

10) In which order will the nurse list the pathophysiologic processes involved in appendicitis?
A) The appendix becomes distended with fluid secreted by its mucosa.
B) The proximal lumen of the appendix becomes obstructed.
C) Purulent exudate forms and causes further distention of the appendix.
D) Pressure within the lumen of the appendix increases.
E) Tissue necrosis occurs and gangrene develops.
Answer: B, A, D, C, E
Explanation: Obstruction of the proximal lumen of the appendix is apparent in most acutely inflamed appendices. Following obstruction, the appendix becomes distended with fluid secreted by its mucosa. Pressure within the lumen of the appendix increases, impairs its blood supply, and leads to inflammation, edema, ulceration, and infection. The purulent exudate formed causes further distention of the appendix. If treatment is not initiated, tissue necrosis and gangrene result within 24-36 hours, leading to perforation (rupture).
Page Ref: 722
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Describe the pathophysiology of appendicitis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

11) For which reason is laparotomy typically the surgery of choice for a perforated appendix?

A) Surgeons are better able to remove contaminants from the peritoneal cavity via laparotomy than via laparoscopy.

B) Laparotomy requires a smaller incision than laparoscopy and thus involves less blood loss.

C) Laparotomy involves a shorter period of postoperative hospitalization than laparoscopy.

D) Laparotomy allows for direct visualization of the damaged appendix, whereas laparoscopy does not.

Answer: A

Explanation: A) When a client's appendix has burst, laparotomy is usually the procedure of choice, because it allows for removal of contaminants from the peritoneal cavity by irrigation with sterile normal saline.

B) A laparotomy does not have a smaller incision than laparoscopy.

C) Recovery from a laparotomy will be longer.

D) Laparoscopy allows for direct visualization of the appendix without the need for open abdominal surgery, requires a shorter postoperative hospital stay, carries a lower risk of postoperative complications, and allows for more rapid recovery and resumption of normal activities.

Page Ref: 724

Cognitive Level: Understanding

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with appendicitis.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

12) A nurse who works in an extended care facility is planning a staff teaching session regarding the care of older adult clients with appendicitis. Which points would be most appropriate for the nurse to include in the lesson plan?
A) "Almost all older clients with appendicitis present with a moderate to high fever."
B) "In older adults, the pain associated with appendicitis tends to fall closer to the midline than to McBurney point."
C) "Older adults with appendicitis rarely present with confusion, although they may be agitated due to severe abdominal pain."
D) "About half of older adult clients with appendicitis do not demonstrate rebound or involuntary guarding."
Answer: D
Explanation: A) Because of decreased function in the immune system, older adults can have a diminished inflammatory response and may not present with the classical signs of appendicitis.
B) When abdominal pain is present in older adults, it is located near McBurney point, not along the midline.
C) Older adults are likely to present with confusion.
D) When older adults present with abdominal pain, appendicitis should be considered.
Page Ref: 725
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 10.A. Analyze appendicitis as it relates to inflammation. Differentiate care of patients with appendicitis across the lifespan.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with appendicitis.

Exemplar 10.B Gallbladder Disease

1) The nurse is caring for a client who was admitted to the hospital 1 day prior with cholelithiasis. Which new assessment finding indicates that the stone has probably obstructed the client's common bile duct?
A) Nausea and vomiting
B) Jaundice
C) Right upper quadrant (RUQ) pain
D) Elevated cholesterol level
Answer: B
Explanation: A) Nausea and vomiting occurs in cystic duct disease.
B) Obstruction of the common bile duct results in reflux of bile into the liver, which produces jaundice.
C) RUQ pain occurs in cystic duct disease.
D) Cholesterol levels do not increase with biliary obstruction.
Page Ref: 728
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Describe the pathophysiology of gallbladder disease.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

2) The nurse is caring for an older adult client with gallbladder disease who is recovering from a cholecystectomy. Which risk factors increase this client's susceptibility to infection? **Select all that apply.**

A) Dry skin

B) Advanced age

C) Intact mucous membranes

D) Nonintact skin

E) Active bowel sounds

Answer: B, D

Explanation: A) Dry skin is a factor that helps defend the body against infection.

B) This client is more susceptible to infection due to advanced age.

C) Having intact mucous membranes is a factor that helps defend the body against infection.

D) This client is more susceptible to infection due to the presence of a surgical incision. A surgical incision indicates that the body's first line of defense, the skin, is not intact.

E) Active bowel sounds have no effect on immunity or susceptibility to developing an infection.

Page Ref: 731-732

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Differentiate care of patients with gallbladder disease across the lifespan.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

3) The nurse educator in a gastrostomy clinic is teaching a group of clients about factors that play a role in the formation of gallstones. Which client would the nurse identify as having the highest risk for gallstone formation due to genetic factors?

A) A client with sickle cell disease
B) A client with a family history of Huntington chorea
C) A client whose father had Alzheimer disease
D) A client with the ABCG5/G8 genetic marker

Answer: D

Explanation: A) Sickle cell disease does not predispose a client to developing gallstones.
B) A family history of Huntington chorea does not predispose the development of gallstones.
C) Alzheimer disease is not a predictive marker for the development of gallstones.
D) There are known genetic factors/variants that predispose carriers for gallbladder disease. Variants of hepatic and intestinal cholesterol transporter ABCG5/G8 are the most common.

Cognitive Level: Analyzing

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Compare the risk factors and prevention of gallbladder disease.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

4) The nurse is caring for an older adult client with cholecystitis. The client has been admitted to the hospital for diagnostic testing and pain control. Which problem would be of highest priority for this client?
A) Anxiety
B) Potential for infection
C) Chronic pain
D) Inability to provide self-care
Answer: B
Explanation: A) There is no evidence that an older client will have a problem with anxiety because of the condition.
B) Because older adults do not have as effective an immune system as younger clients, the problem of a potential for infection would be the priority.
C) The client will most likely experience acute pain and not chronic pain.
D) There is no evidence that the client will not be able to participate in self-care.
Page Ref: 732
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosing

Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Differentiate care of patients with gallbladder disease across the lifespan.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

5) A client who is 4 days post-cholecystectomy has T-tube drainage totaling 600 mL in 24 hours. Which actions by the nurse are appropriate at this time? **Select all that apply.**
A) Notify the healthcare provider.
B) Place the client in a supine position.
C) Assess drainage characteristics.
D) Clamp the tube q 2 hours for 30 minutes.
E) Encourage increased fluid intake.
Answer: A, C
Explanation: A) The T-tube may drain 500 mL in the first 24 hours and is expected to decrease steadily thereafter. If there is excessive drainage, as in this scenario, the nurse should further assess the drainage to be able to describe it accurately and notify the healthcare provider immediately.
B) Placing the client in a supine position would not be beneficial.
C) The T-tube may drain 500 mL in the first 24 hours and is expected to decrease steadily thereafter. If there is excessive drainage, as in this scenario, the nurse should further assess the drainage to be able to describe it accurately.
D) Clamping the tube would be contraindicated.
E) Encouraging fluids would not be beneficial.
Page Ref: 733
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with gallbladder disease.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

6) The nurse is evaluating care provided to an older adult client with a history of cholecystitis 5 months ago. Which statement indicates that the client met a goal in the plan of care?

A) "I have increased my intake of fat."
B) "I have been eating out often."
C) "I have been walking 1 mile every day."
D) "I have been able to gain 5 pounds on the new diet."

Answer: D

Explanation: A) The client would want to decrease fat intake.
B) Eating out would not be a goal for a client being treated for cholecystitis.
C) Exercise is excellent but does not directly support actions related to cholecystitis.
D) The older adult client with cholecystitis is at elevated risk for infection. Thus, a goal would be to stabilize or increase weight through appropriate dietary measures to support the client's immune system and resist infection.

Page Ref: 733

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Differentiate care of patients with gallbladder disease across the lifespan.

WW.TBSM.WS

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

7) Which lifestyle change would most likely increase a client's risk for cholelithiasis?
A) Reducing intake of high-fat foods
B) Increasing intake of high-cholesterol foods
C) Beginning a regular exercise routine
D) Discontinuing use of hormonal birth control
Answer: B
Explanation: A) Reducing high-fat foods would reduce the risk for cholelithiasis.
B) Several factors increase a client's risk for gallbladder disease, including consuming foods that are high in fat and cholesterol.
C) Exercise can aid in weight control, thereby reducing a client's risk for gallbladder disease.
D) Eliminating the use of hormonal birth control will reduce the risk for cholelithiasis.
Page Ref: 729
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Compare the risk factors and prevention of gallbladder disease.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

8) A client with cholelithiasis is in the clinic for a follow-up assessment after hospitalization. Which lifestyle modification should the nurse teach the client to decrease the pain associated with the disease process?
A) Reduce sodium intake.
B) Decrease fat consumption.
C) Increase fluids.
D) Decrease smoking.
Answer: B
Explanation: A) Although all clients should be instructed to reduce sodium intake, decreasing sodium will not assist in reducing cholelithiasis or its pain.
B) A client who is experiencing cholelithiasis should be instructed on the relationship between increased fat consumption and the severity of pain associated with cholelithiasis.
C) Increasing fluids will not assist in reducing cholelithiasis or its pain.
D) While all clients should be encouraged to cease smoking, smoking has no relationship to cholelithiasis.
Page Ref: 729
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with gallbladder disease.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

9) The nurse is caring for a client with severe acute abdominal pain secondary to cholelithiasis. Which nursing actions promote effective pain management? **Select all that apply.**

A) Withhold oral food and fluids.

B) Insert nasogastric tube and connect to high suction.

C) Educate the client about decreasing protein in the diet, because protein increases gallbladder contractions.

D) Administer morphine, meperidine, or another opioid analgesic as ordered.

E) Place the patient in supine position to relieve abdominal pain.

Answer: A, D

Explanation: A) The pain associated with cholelithiasis can be severe. Nursing interventions that help promote effective pain management include withholding oral food and fluids.

B) Nursing interventions that help promote effective pain management include inserting a nasogastric tube connected to low suction if ordered.

C) The nurse should educate the client about decreasing fat in the diet, because fat entering the duodenum initiates gallbladder contractions, causing pain when gallstones are in the ducts.

D) Administering morphine or another opioid analgesic as ordered also aids in pain management.

E) The nurse should place the patient in Fowler position, not supine, to decrease pressure on the inflamed gallbladder.

Page Ref: 732-733

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with gallbladder disease.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

10) Which medication is used to reduce the cholesterol content of gallstones and lead to their gradual dissolution?
A) Cholestyramine
B) Chenodiol
C) Meperidine
D) Amoxicillin
Answer: B
Explanation: A) Cholestyramine (Questran) is administered to relieve jaundice and pruritus related to accumulation of bile salts on the skin.
B) Chenodiol (Chenix) is administered to reduce the cholesterol content of gallstones and lead to their gradual dissolution. This drug acts by reducing cholesterol production in the liver, thus reducing the cholesterol content of bile.
C) Because of all the different metabolites, toxicity, and poor pain control, meperidine is not recommended as an analgesic unless the patient is allergic to all other opioids.
D) Amoxicillin is given to reduce the likelihood of infection.

Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a gallbladder disease.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

11) Which laboratory result suggests that a client with gallbladder disease is experiencing obstructed bile flow in the biliary duct system?

A) Decreased WBC count

B) Elevated WBC count

C) Decreased direct bilirubin

D) Elevated direct bilirubin

Answer: D

Explanation: A) Clients with gallbladder disease often have an elevated WBC count.

B) Although clients with gallbladder disease often have an elevated WBC count, this result is suggestive of infection and inflammation rather than obstructed bile flow.

C) In clients with gallbladder disease, the direct bilirubin level will not be decreased.

D) In clients with gallbladder disease, elevated direct bilirubin may indicate obstructed bile flow in the biliary duct system.

Learning Outcome: 10.B. Analyze gallbladder disease as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a gallbladder disease.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with gallbladder disease.

Exemplar 10.C Inflammatory Bowel Disease

1) An adolescent client is experiencing abdominal pain with diarrhea and bloody stools. Which type of inflammatory bowel disease does the nurse suspect the client is experiencing?
A) Appendicitis
B) Ulcerative colitis
C) Crohn disease
D) Necrotizing enterocolitis
Answer: B
Explanation:
A) Appendicitis is not associated with bloody stools, and usually not with diarrhea.
B) Diarrhea and bloody stools are typical symptoms of ulcerative colitis.
C) An adolescent with Crohn disease might have abdominal pain and diarrhea, but stools usually do not have blood in them.
D) Necrotizing enterocolitis is usually seen in premature infants and not generally in adolescent clients.
Page Ref: 737
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.C. Analyze inflammatory bowel disease (IBD) as it relates to inflammation. Identify the clinical manifestations of IBD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with inflammatory bowel disease.

2) The nurse is caring for an adolescent client who has been nonadherent to the medical plan of care to treat Crohn disease. In order to increase adherent behavior, which complication associated with Crohn disease should the nurse include in the client's teaching plan?
A) Vomiting
B) Bowel perforation
C) Intestinal obstruction
D) Diarrhea
Answer: B
Explanation: A) Vomiting is a common symptom of Crohn disease and may occur even if the client is compliant with the medical plan of care.
B) Bowel perforation is rare but may be a consequence of noncompliance with the treatment plan, because the client's disease would continue to progress.
C) Intestinal obstruction is a common symptom of Crohn disease and may occur even if the client is compliant with the medical plan of care.
D) Diarrhea is a common symptom of Crohn disease and may occur even if the client is compliant with the medical plan of care.
Page Ref: 740

Learning Outcome: 10.C. Analyze inflammatory bowel disease (IBD) as it relates to inflammation. Identify the clinical manifestations of IBD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with inflammatory bowel disease.

3) Which statement is true about ulcerative colitis and Crohn disease?
A) Clients with ulcerative colitis experience periods of remission, whereas clients with Crohn disease do not.
B) Ulcerative colitis is limited to the colon and rectum, whereas Crohn disease can affect any part of the GI tract.
C) The inflammatory lesions associated with Crohn disease are continuous, whereas those associated with ulcerative colitis are not.
D) Ulcerative colitis is more common in women, whereas Crohn disease is more common in men.
Answer: B
Explanation: A) Ulcerative colitis and Crohn disease are chronic diseases with periods of remission and active disease.
B) Ulcerative colitis is limited to the colon and rectum, whereas Crohn disease can affect any part of the GI tract from mouth to anus.
C) Ulcerative colitis involves continuous lesions, whereas Crohn disease is marked by patchy or "skip" lesions.
D) Ulcerative colitis and Crohn disease affect both genders equally.
Page Ref: 735
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Learning Outcome: 10.C. Analyze inflammatory bowel disease (IBD) as it relates to inflammation. Identify the clinical manifestations of IBD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with inflammatory bowel disease.

4) The nurse provides teaching related to the problem of risk for fluid volume deficit to a client with ulcerative colitis. Which statement on the part of the client indicates that this teaching has been effective?
A) "I will drink at least 2 quarts of fluid each day."
B) "I will continue to use a moisturizer on my skin."
C) "I should report dry patches of skin immediately to my doctor."
D) "If I have two liquid stools in any day, I will report this to my healthcare provider."
Answer: A
Explanation: A) The client with irritable bowel syndrome should be taught to maintain a higher-than-normal fluid intake to maintain hydration.
B) Moisturizing the skin is a positive action for this client but does not indicate appropriate understanding of the teaching that is appropriate for this problem.
C) The client's dry patches could be due to a fluid volume deficit but would not necessitate immediate notification.
D) Two liquid stools a day is not excessive for a client with ulcerative colitis, but the client must remember to take in enough fluid to account for these stools as well as the normal fluid needs of the body.
Page Ref: 745
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity
Standards: QSEN Competencies: I.A.1. MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with inflammatory bowel disease.

5) Which condition is the leading indication for surgery in Crohn disease?
A) Bowel obstruction
B) Internal fistula
C) Perianal complications
D) Abscess
Answer: A
Explanation: A) Bowel obstruction is the leading indication for surgery in Crohn disease.
B) Other complications that less commonly require surgical intervention include an internal fistula.
C) Other complications that less commonly require surgical intervention include perianal complications.
D) Other complications that less commonly require surgical intervention include an abscess.

Learning Outcome: 10.C. Analyze inflammatory bowel disease (IBD) as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with IBD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with inflammatory bowel disease.

6) A home health nurse is evaluating a client who had a colostomy placed 6 weeks ago for the treatment of ulcerative colitis. Which assessment would cause the nurse to conclude that teaching goals for this client have been met?
A) The client's colostomy pouch is clean and dry.
B) The client's vital signs reveal a normal temperature.
C) The client's stoma is pink and intact.
D) The client experiences pain with certain types of food.
Answer: C
Explanation: A) It is not as critical that the ostomy pouch be clean and dry, particularly if the client has passed a stool.
B) A normal temperature would not be a particular goal for a client 6 weeks postoperatively.
C) Stoma care is taught to the client after surgery, and the goal is for the stoma to be pink with intact skin.
D) Patients with ulcerative colitis are going to have pain when they eat foods that irritate the bowel, but this is not a goal.
Page Ref: 741
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with inflammatory bowel disease.

7) A client is being scheduled for diagnostic tests to determine the presence of ulcerative colitis. For which diagnostic tests should the nurse plan to provide teaching? **Select all that apply.**
A) Barium enema
B) Intravenous pyelogram
C) Colonoscopy
D) Upper endoscopy
E) Barium swallow
Answer: A, C, E
Explanation: A) Tests to diagnose ulcerative colitis include a barium enema.
B) An intravenous pyelogram is used to diagnose kidney disorders.
C) Tests to diagnose ulcerative colitis include a colonoscopy.
D) An upper endoscopy is used to diagnose disorders of the esophagus and stomach.
E) Tests to diagnose ulcerative colitis include a barium swallow.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with inflammatory bowel disease.

8) The nurse is receiving a client from the emergency department who was diagnosed with an acute exacerbation of ulcerative colitis. The nurse anticipates that the client may present with which clinical characteristics? **Select all that apply.**
A) More than 6 diarrhea stools per day with blood and mucus
B) Steady right lower quadrant or periumbilical pain
C) Cramping in the left lower quadrant that is relieved by defecation
D) Tenderness and a mass in the right lower quadrant
E) Fever, malaise, and fatigue
Answer: A, C
Explanation: A) With severe ulcerative colitis, the client may have more than 6 diarrhea stools per day with blood and mucus.
B) A client with Crohn disease will experience steady right lower quadrant or periumbilical pain.
C) The pain associated with ulcerative colitis presents with cramping in the left lower quadrant which is relieved by defecation.
D) Tenderness and a mass in the right lower quadrant are characteristics of Crohn disease.
E) Fever, malaise, and fatigue are characteristics of Crohn disease.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.C. Analyze inflammatory bowel disease (IBD) as it relates to inflammation. Identify the clinical manifestations of IBD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with inflammatory bowel disease.

9) The nurse is caring for a pediatric client with inflammatory bowel disease (IBD). Which symptoms should the nurse expect to assess in this client when compared to an adult with the same condition? **Select all that apply.**
A) More frequent symptoms of Crohn disease than ulcerative colitis
B) Development of fistulas or strictures
C) Colonic involvement
D) Left-sided colitis
E) More common in females than males
Answer: A, C
Explanation: A) Children suffer from Crohn disease more frequently than ulcerative colitis.
B) Children with Crohn disease usually present with inflammatory disease; adults often present with fistulizing or stricturing disease.
C) The majority of pediatric clients have ileocolonic or colonic disease.
D) Children with ulcerative colitis usually present with pancolitis, whereas adults more often present with left-sided colitis.
E) IBD is more common in males than females in the pediatric population.
Page Ref: 742
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 10.C. Analyze inflammatory bowel disease (IBD) as it relates to inflammation. Differentiate care of patients with IBD across the lifespan.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with inflammatory bowel disease.

Exemplar 10.D Nephritis

1) The nurse is caring for a client newly admitted to the medical-surgical unit with glomerulonephritis. Which classic manifestations of this disorder should the nurse expect to assess in this client? **Select all that apply.**
A) Edema
B) Weight loss
C) Hematuria
D) Acute flank pain
E) Proteinuria
Answer: A, C, D, E
Explanation: A) As the disease progresses, there will be an increase in edema, especially in the lower legs and ankles during the daytime.
B) Weight loss is a nonspecific symptom that can occur with many disorders, but not typically with glomerulonephritis.
C) Hematuria is a classic sign of glomerulonephritis.
D) Flank pain can develop abruptly in glomerulonephritis.
E) Proteinuria is a classic sign of glomerulonephritis.
Page Ref: 750
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Identify the clinical manifestations of nephritis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

WwW.TeSt.Ng

2) The nurse conducts an evaluation after completing a training session for community members on ways to prevent nephritis. When evaluating the success of this session, what responses from the community members would indicate that learning has been successful? **Select all that apply.**

A) "Practicing good hygiene can help prevent nephritis."
B) "One way to help avoid nephritis is by not smoking."
C) "Maintaining a healthy body weight helps promote kidney health."
D) "I should limit my alcohol intake to reduce the risk of nephritis."
E) "Controlling high blood pressure is important in the prevention of nephritis."

Answer: A, B, C, E

Explanation: A) The exact cause of nephritis is unknown but preventing viral infections through practicing good hygiene habits reduces the risk of developing this disease.
B) The exact cause of nephritis is unknown, but not smoking reduces the risk of developing this disease.
C) The exact cause of nephritis is unknown but maintaining a healthy body weight reduces the risk of developing this disease.
D) Limiting alcohol intake will not affect the development of nephritis.
E) The exact cause of nephritis is unknown but controlling high blood pressure reduces the risk of developing this disease.

Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

W W . T B S M . W S

Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Compare the risk factors and prevention of nephritis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

3) The nurse is caring for a Black client with nephritis. When planning this client's care, the nurse should include interventions aimed at preventing which of the following long-term complications?
A) Congestive heart failure
B) Diabetes mellitus
C) End-stage renal disease
D) Hypertension
Answer: C
Explanation: A) Black clients are not at increased risk of developing congestive heart failure after nephritis.
B) Black clients are not at increased risk of developing diabetes mellitus after nephritis.
C) Black clients have an increased risk of progressing to end-stage renal disease after nephritis.
D) Black clients are not at increased risk of developing hypertension after nephritis.
Page Ref: 750
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with nephritis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

4) The nurse has identified the problem of fluid volume excess as appropriate for a client with acute glomerulonephritis. Which parameter should the nurse assess to obtain the most accurate indication of this client's fluid balance?
A) Vital signs
B) Intake and output records
C) Daily weight
D) Serum sodium levels
Answer: C
Explanation: A) Vital signs will provide data about fluid balance; however, they will not provide the most accurate information.
B) Intake and output records will all provide data indicating fluid balance; however, it is not as accurate as daily weight for determining fluid balance.
C) Daily weight provides the most accurate indication of fluid balance because of the pathophysiology of acute glomerulonephritis.
D) Serum sodium levels will all provide data indicating fluid balance; however, they are not as accurate as daily weight for determining fluid balance.
Page Ref: 754
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with nephritis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

5) A client being discharged after treatment for nephritis is concerned about having adequate stamina to care for the family after discharge. Which statement made by the nurse would be most appropriate to address the client's concern?

A) "Tell your spouse help is needed."
B) "You will be able to keep up with your family's needs once you return home."
C) "It sounds like you need some help, so I'll contact Social Services for support."
D) "Maybe your children should stay with a relative or neighbor for a few weeks."

Answer: C

Explanation: A) The nurse should not assume that the client has a spouse.
B) The client will be easily fatigued and will need assistance after treatment for nephritis.
C) The nurse should contact Social Services to obtain support for the client.
D) The client might not have family nearby or neighbors who are available to care for the children for a few weeks.

Page Ref: 754

Cognitive Level: Applying

Client Need/Sub: Psychosocial Integrity

Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with nephritis.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

6) A client is experiencing weight gain and foamy dark urine 4 weeks after being treated with antibiotics for a sore throat. Which client statement, made during the health history assessment, suggests that the nurse should provide the client with further instruction?
A) "I've been trying to get plenty of rest since I've been sick."
B) "I've started eating a more nutritious diet."
C) "I felt better after 1 week of the antibiotics, so I stopped taking them."
D) "I've gained a bit of weight over the last 2 weeks."
Answer: C
Explanation: A) Resting when ill is appropriate.
B) Eating a more nutritious diet is appropriate.
C) The client probably had strep throat and did not take the full course of antibiotics, which accounts for the current symptoms that indicate glomerulonephritis.
D) Gaining weight would support the nurse's suspicion that the client has glomerulonephritis.
Page Ref: 753
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with nephritis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

7) A client being treated for nephrotic syndrome is a vegetarian and has recently experienced poor oral intake. Which action should the nurse take to meet this client's nutritional needs?
A) Request that the healthcare provider prescribe an appetite stimulant.
B) Request that a dietitian discuss dietary preferences with the client.
C) Encourage the client to eat the food provided on the meal trays.
D) Explain that the client will be returning home soon and can resume a preferred diet.
Answer: B
Explanation: A) An appetite stimulant is not going to improve the client's appetite if foods are provided that the client does not eat.
B) The client is being treated for nephrotic syndrome, which could impact the amount of protein permitted to be eaten each day. The client should discuss dietary preferences with a dietitian so that the client's nutritional needs will be met.
C) The nurse should not encourage the client to eat foods that do not support the client's vegetarian diet.
D) The nurse needs to help the client now and not have the client wait to go to home before having foods that the client wants to eat.
Page Ref: 754
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with nephritis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

8) A child who is hospitalized with acute glomerulonephritis experiences blurred vision and headache while in the playroom. Which action by the nurse is the most appropriate?
A) Reassure the child and encourage bed rest until the headache improves.
B) Obtain the child's blood pressure and notify the physician.
C) Check the child's urine to see if hematuria has increased.
D) Obtain the child's serum electrolytes and send a urinalysis to the lab.
Answer: B
Explanation: A) Encouraging bed rest does not directly address the potential problem of encephalopathy.
B) Blurred vision and headache may be signs of encephalopathy, a complication of acute glomerulonephritis. The nurse should obtain a blood pressure reading and notify the physician.
C) Checking urine for hematuria does not directly address the potential problem of encephalopathy.
D) Obtaining serum electrolytes and a urine specimen do not directly address the potential problem of encephalopathy.
Page Ref: 753
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Differentiate care of patients with nephritis across the lifespan.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

9) The nurse is assessing an older adult client with suspected acute interstitial nephritis. When gathering this client's health history, the nurse should be sure to ask the client which question?
A) "When is the last time you had a urinalysis?"
B) "Are you taking any medications for the treatment of indigestion?"
C) "Do you take any ACE inhibitors?"
D) "How much protein do you eat on an average day?"
Answer: B
Explanation: A) Although the client will require urinalysis, the timing of the client's last urine test is not important.
B) The nurse should inquire whether the client is taking any medications for the treatment of indigestion, because many cases of acute interstitial nephritis in older adults are due to use of proton pump inhibitors.
C) Angiotensin-converting enzyme (ACE) inhibitors do not contribute to a client's likelihood of acute interstitial nephritis.
D) Protein intake is unrelated to this diagnosis.
Page Ref: 712
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Differentiate care of patients with nephritis across the lifespan.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

10) Which diagnostic procedure for glomerular disorders is essential and the most reliable?
A) Kidney scan
B) KUB abdominal x-ray
C) ASO titer
D) Biopsy
Answer: D
Explanation: A) A kidney scan allows visualization of the kidney after IV administration of a radioisotope, but the results are not as definitive as with a biopsy.
B) A KUB (kidney, ureter, bladder) abdominal x-ray may be done to evaluate kidney size and to rule out other causes of the patient's manifestations, but not to definitively diagnose glomerular disorders.
C) ASO titers and similar blood tests detect streptococcal exoenzymes that stimulate the immune response in acute postinfection glomerulonephritis, but they cannot provide a clear diagnosis of glomerular dysfunction.
D) A biopsy is the essential and most reliable diagnostic procedure for glomerular disorders. A biopsy helps determine the type of nephritis, the prognosis, and the appropriate treatment.
Page Ref: 751
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with nephritis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

11) Which laboratory value increases in the presence of renal impairment?
A) Creatinine clearance
B) Urine creatinine
C) Serum creatinine
D) Total urine output
Answer: C
Explanation: A) Creatinine clearance decreases in the presence of renal impairment.
B) Urine creatinine decreases in the presence of renal impairment.
C) Serum creatinine is excreted entirely by the kidneys, making it a good indicator of kidney function. Elevations in serum creatinine levels indicate impairment of renal function.
D) Total urine output decreases in the presence of renal impairment.
Page Ref: 751
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 10.D. Analyze nephritis as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with nephritis.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with nephritis.

Exemplar 10.E Peptic Ulcer Disease

1) A client is being treated with blood transfusions for a large peptic ulcer in the duodenum. Which information in the client's history should the nurse suspect as a potential cause of this health problem?
A) Allergies to penicillin and morphine sulfate
B) History of chronic atrial fibrillation
C) Daily medications include naproxen sodium and aspirin
D) History of recent cataract extraction with lens implant
Answer: C
Explanation: A) Allergies to penicillin and morphine sulfate are not relevant to the client's bleeding incident.
B) History of atrial fibrillation is not relevant to the client's bleeding incident.
C) Clients who are taking high doses of nonsteroidal anti-inflammatory agents (NSAIDs) such as naproxen sodium and aspirin are predisposed to developing large ulcers that do not cause pain. The first symptom the client often experiences is a significant bleeding episode. Concurrent use of NSAIDs and aspirin should, therefore be, avoided.
D) Recent eye surgery is not relevant to the client's bleeding incident.
Page Ref: 757
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 10.E. Analyze peptic ulcer disease (PUD) as it relates to inflammation. Compare the risk factors and prevention of PUD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

2) The nurse is planning a teaching session for older community members about the risks for peptic ulcer disease (PUD) in this age group. Which information should the nurse include when teaching this group?
A) PUD causes less bleeding in older clients than in younger clients.
B) Older clients experience more severe abdominal pain than younger clients with PUD.
C) Older clients should undergo colonoscopy when diagnosed with PUD.
D) PUD is likely exacerbated by the bacterium *Helicobacter pylori* (*H. pylori*).
Answer: D
Explanation: A) There is no evidence that PUD causes less bleeding in older clients.
B) There is no evidence that older clients experience more severe abdominal pain with PUD.
C) Clients with peptic ulcers should have upper GI endoscopy performed to diagnose the problem with visualization and biopsy, not colonoscopy.
D) *H. pylori* infection is a major factor in the development of ulcers, and prevalence increases with the age of the client.
Page Ref: 760
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 10.E. Analyze peptic ulcer disease (PUD) as it relates to inflammation. Differentiate care of patients with PUD across the lifespan.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

3) The healthcare provider prescribes misoprostol (Cytotec) for a female client for the treatment of peptic ulcer disease. Which question should the nurse ask the client prior to administration of this medication?
A) "Is there any chance that you are pregnant?"
B) "Are you currently sexually active?"
C) "Are your menstrual cycles irregular?"
D) "Do you plan on becoming pregnant in the next few months?"
Answer: A
Explanation: A) Misoprostol (Cytotec) is contraindicated during pregnancy.
B) Asking if client is sexually active could be appropriate, but the nurse would also ask if the client is using birth control.
C) There is no contraindication for misoprostol (Cytotec) in a client with irregular menstrual cycles.
D) Misoprostol (Cytotec) is safe as long as the client is not pregnant.
Page Ref: 760
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 10.E. Analyze peptic ulcer disease (PUD) as it relates to inflammation. Differentiate care of patients with PUD across the lifespan.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

4) The nurse is caring for a client who receives H_2-receptor antagonists for the treatment of peptic ulcer disease. Based on the problem of bleeding, which assessment finding should the nurse report immediately to the healthcare provider?
A) The client reports pain after 24 hours of treatment.
B) The client reports episodes of melena.
C) The client reports constipation.
D) The client reports taking Tums antacids with his H_2-receptor antagonist.
Answer: B
Explanation: A) The client may still experience pain for several days with this type of medication.
B) Melena could indicate GI bleeding and should be reported to the physician immediately.
C) Constipation is a common side effect that does not need to be immediately reported to the healthcare provider.
D) Taking Tums antacids with an H_2-receptor antagonist will cause decreased absorption of the H_2-receptor antagonist, but this does not need to be reported to the healthcare provider; rather, the nurse should educate the client.
Page Ref: 761
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 10.E. Analyze peptic ulcer disease (PUD) as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with PUD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

5) Which drug used in the treatment of peptic ulcer disease (PUD) works by both binding to proteins in the ulcer base and stimulating the secretion of mucus?
A) Sucralfate
B) Omeprazole
C) Misoprostol
D) Bismuth
Answer: A
Explanation: A) All of the medications listed can be used to treat PUD, but they work in different ways. Sucralfate binds to proteins in the ulcer base, forming a protective barrier against acid, bile, and pepsin. Sucralfate also stimulates the secretion of mucus, bicarbonate, and prostaglandin.
B) Omeprazole is a proton-pump inhibitor (PPI).
C) Misoprostol promotes ulcer healing by stimulating mucus and bicarbonate secretions and inhibiting acid secretion.
D) Bismuth compounds stimulate mucosal bicarbonate and prostaglandin production to promote ulcer healing and suppress *Helicobacter pylori*.
Page Ref: 760
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Learning Outcome: 10.E.3. Analyze peptic ulcer disease (PUD) as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with PUD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

6) The nurse provides discharge teaching for a client with peptic ulcer disease (PUD). Which client statement indicates that teaching has been effective?
A) "I will drink more milk and limit spicy foods."
B) "I will take ibuprofen (Motrin) for my headaches."
C) "I am taking smoking cessation classes."
D) "I will join a gym and increase my exercise."
Answer: C
Explanation: A) Diet is usually not a major factor in the development of peptic ulcers, so eating or avoiding specific foods is not currently encouraged for the treatment of PUD.
B) Nonsteroidal anti-inflammatory drugs (NSAIDs) like Motrin should be avoided because they are a primary cause of PUD.
C) Cigarette smoking inhibits the secretion of bicarbonate by the pancreas and may cause more rapid transit of gastric acid into the duodenum leading to the development of PUD.
D) There is no correlation between exercise and the management of PUD.
Page Ref: 719
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 10.E.4. Analyze peptic ulcer disease (PUD) as it relates to inflammation. Apply the nursing process in providing culturally competent care to an individual with PUD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

7) A client with *Helicobacter pylori* asks the nurse why bismuth (Pepto-Bismol) has been prescribed along with oral antibiotics for treatment. Which information should the nurse include when explaining about the use of Pepto-Bismol for treatment of this health problem? **Select all that apply.**
A) "It helps prevent the side effects of antibiotics."
B) "It increases stomach acid to help kill bacteria."
C) "It helps relieve ulcer-related constipation."
D) "It is effective with inhibiting bacterial growth."
E) "It stimulates the production of substances that promote ulcer healing."
Answer: D, E
Explanation: A) Bismuth does not prevent all side effects of antibiotics.
B) Bismuth does not increase stomach acid.
C) Bismuth is used to relieve diarrhea, not constipation.
D) Bismuth compounds (Pepto-Bismol) are added to the antibiotic regimen to inhibit bacterial growth.
E) Bismuth compounds stimulate mucosal bicarbonate and prostaglandin production to promote ulcer healing.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

WwW.TeSM.Ws

8) The nurse is planning a teaching session regarding peptic ulcers for the residents of an assisted-living complex. Which concepts about peptic ulcer disease should the nurse include in the presentation to the residents? **Select all that apply.**
A) A colonoscopy is the most common test used to diagnose the presence of a gastric ulcer.
B) Gastric ulcers are more common than duodenal ulcers.
C) Many peptic ulcers are infected with *Helicobacter pylori* (*H. pylori*) and are treated with antibiotics.
D) The first sign of a peptic ulcer may be serious gastrointestinal bleeding.
E) An individual with a peptic ulcer will most likely experience pain when the stomach is empty.
Answer: C, D, E
Explanation: A) Tests used to diagnose a gastric ulcer include endoscopy and *H. pylori* testing.
B) Duodenal ulcers are more common than gastric ulcers.
C) Peptic ulcers that are infected with *H. pylori* will often be treated with antibiotics.
D) The client with a peptic ulcer may be largely asymptomatic until there is an episode of gastrointestinal bleeding.
E) The individual who has a peptic ulcer will most likely have abdominal pain when the stomach is empty.
Page Ref: 757
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 10.E.3. Analyze peptic ulcer disease (PUD) as it relates to inflammation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with PUD.
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

9) The nurse is educating a client with peptic ulcer disease (PUD) about *Helicobacter pylori* (*H. pylori*) and its role in PUD. Which statements by the nurse are appropriate to include in the teaching session? **Select all that apply.**

A) "*H. pylori* produces enzymes that improve the efficacy of mucous gel in protecting the gastric mucosa."

B) "*H. pylori* infection is found in about 25% of individuals with PUD."

C) "Your inflammatory response to *H. pylori* contributes to gastric cell damage."

D) "*H. pylori* infection increases production of gastric acids."

E) "*H. pylori* infection is spread by droplets in the air."

Answer: C, D

Explanation: A) The bacteria produce enzymes that reduce the efficacy of mucous gel in protecting the gastric mucosa.

B) *H. pylori* infection, found in about 70% of individuals who have PUD, is unique in colonizing the stomach.

C) The host's inflammatory response to *H. pylori* contributes to gastric epithelial cell damage without producing immunity to the infection.

D) *H. pylori* infection also increases the production of gastric acids.

E) It is spread from individual to individual (oral-oral or fecal-oral).

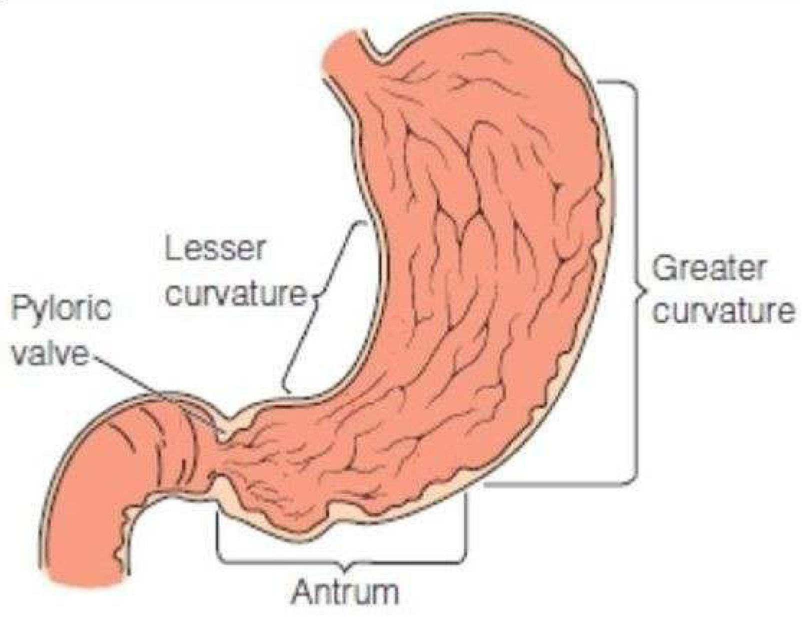
Learning Outcome: 10.E.1. Analyze peptic ulcer disease (PUD) as it relates to inflammation. Describe the pathophysiology of PUD.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

10)



Which two areas are the most likely locations for a gastric ulcer to develop? **Select all that apply.**

A) Lesser curvature
B) Greater curvature
C) Distal to the pylorus
D) Proximal to the pylorus
E) Pyloric valve

Answer: A, D

Explanation: A) Gastric ulcers often are found on the lesser curvature, and the area immediately proximal (not distal) to the pylorus.
B) Gastric ulcers are not often found on the greater curvature.
C) Gastric ulcers are not found distal to the pylorus.
D) Gastric ulcers often are found on the area immediately proximal to the pylorus.
E) Gastric ulcers do not develop at the area of the pyloric valve.

MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

11) Why is steatorrhea a common manifestation of Zollinger-Ellison syndrome?
A) The high levels of hydrochloric acid associated with Zollinger-Ellison syndrome lead to impaired protein digestion.
B) The high levels of hydrochloric acid associated with Zollinger-Ellison syndrome lead to impaired fat digestion.
C) The large colonies of *Helicobacter pylori* (*H. pylori*) associated with Zollinger-Ellison syndrome lead to impaired protein digestion.
D) The large colonies of *H. pylori* associated with Zollinger-Ellison syndrome lead to impaired fat digestion.
Answer: B
Explanation: A) The high levels of hydrochloric acid associated with Zollinger-Ellison syndrome do not lead to impaired protein digestion.
B) Zollinger-Ellison syndrome is a form of PUD caused by a gastrinoma, or gastrin-secreting tumor. Gastrin is a hormone that stimulates the secretion of pepsin and hydrochloric acid. The high levels of hydrochloric acid entering the duodenum overwhelm the protective buffering mechanism; the result is diarrhea and steatorrhea from impaired fat digestion and absorption.
C) *Helicobacter pylori* (*H. pylori*) does not cause Zollinger-Ellison syndrome.
D) *Helicobacter pylori* (*H. pylori*) does not cause Zollinger-Ellison syndrome.

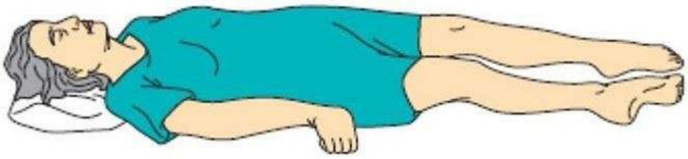
MNL LO: Demonstrate understanding of the concept of inflammation in the care of a patient with peptic ulcer disease.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e **(Pearson)**
Module 11 Intracranial Regulation

The Concept of Intracranial Regulation

1) A client who sustained a head injury from a motor vehicle crash begins to demonstrate an abnormal posture. (See image.) Which should the nurse suspect is occurring with the client's brain functioning?



A) Improved level of consciousness
B) Developing a seizure disorder
C) Brainstem impairment
D) Corticospinal tract impairment
Answer: C
Explanation: A) Altered level of consciousness (LOC), not improved level of consciousness, is an early manifestation of the deterioration of the function of the cerebral hemispheres.
B) Seizure disorders have various types of motor postures.
C) Structures in the brainstem have characteristic changes in motor function. Evidence of brainstem involvement includes decerebrate posturing that is distinguished by rigid extension.
D) Corticospinal tract impairment is characterized by decorticate posturing, which is rigid flexion.
Page Ref: 773
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 11.2. Differentiate alterations to intracranial regulation.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

www.1PSM.ws

2) An adult client with increased intracranial pressure caused from a head injury has a Glasgow Coma Scale (GCS) score of 6. Which finding will the nurse expect to assess in this client?
A) Extension to painful stimuli
B) Spontaneous eye opening
C) Oriented to time, place, and person
D) Withdraws to touch
Answer: A
Explanation: A) The client's score is low, so the finding of extension to painful stimuli, a 2 out of a possible 6 for motor response, is most likely for this client.
B) Findings of spontaneous eye opening (a 4 on the scale for eye opening, the maximum score) is unlikely.
C) Being oriented to time, place, and person (a 5 for verbal response and also the maximum score for that component) is unlikely.
D) An assessment finding of withdraws to touch would be more typical of an infant or young child, not an adult, and would be a 5 out of 6 for motor response.
Page Ref: 779
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
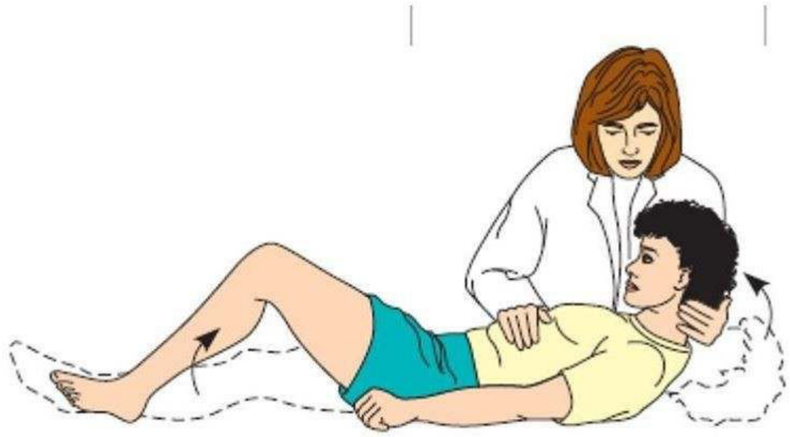
Standards: QSEN Competencies: III.A.1. Learning Outcome: 11.2. Differentiate alterations to intracranial regulation.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

3) A school-age client is experiencing photophobia, a sore neck, chills, and fever. For which reason did the nurse use the technique in the exhibit when assessing the client?



A) It is a routine part of the physical assessment.
B) Flexion of the hips or knees would be consistent with meningitis.
C) The nurse was assessing range of motion of the neck.
D) This technique assesses optic nerve functioning.
Answer: B
Explanation: A) Assessing for the Brudzinski sign is not a routine part of the physical assessment.
B) The client's manifestations of a sore neck, chills, fever, and photophobia are consistent with meningitis. Assessing for the Brudzinski sign can rule in meningitis because flexing the client's head to the chest will trigger flexion of the hips and knees in clients with meningeal irritation.
C) This maneuver is not done to assess for neck range of motion.
D) This maneuver is not done to assess for optic nerve functioning.

Learning Outcome: 11.5. Differentiate common assessment procedures and tests used to examine intracranial regulation.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

WWW.TBSM.US

4) The nurse is reviewing results of diagnostic testing performed on a client with increased intracranial pressure (ICP). Which diagnostic test results should the nurse make available to the healthcare provider for review? **Select all that apply.**
A) Bronchoscopy results
B) MRI result
C) Head CT scan with and without contrast
D) Electroencephalogram
E) Cerebrospinal fluid differential cell count
Answer: B, C, D, E
Explanation: A) Bronchoscopy is not performed routinely for a client with increased intracranial pressure.
B) Diagnosis of increased ICP is made on the basis of observation and neurologic assessment; even subtle changes can be clinically significant. Testing can include an MRI.
C) Diagnosis of increased ICP is made on the basis of observation and neurologic assessment; even subtle changes can be clinically significant. Testing can include CT scan with and without contrast.
D) Diagnosis of increased ICP is made on the basis of observation and neurologic assessment; even subtle changes can be clinically significant. Testing can include an electroencephalogram.
E) Diagnosis of increased ICP is made on the basis of observation and neurologic assessment; even subtle changes can be clinically significant. Testing can include cerebrospinal fluid evaluation.

Learning Outcome: 11.5. Differentiate common assessment procedures and tests used to examine intracranial regulation.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

5) The nurse is determining ways to decrease environmental stimuli for a client with increased intracranial pressure. Which actions should the nurse take to support this client's care need? **Select all that apply.**
A) Limit the client's visitors.
B) Teach family to speak softly and minimize touching.
C) Elevate the head of the bed.
D) Raise pads and bedrails.
E) Keep the room dark and quiet.
Answer: A, B, E
Explanation: A) Visitors should be limited.
B) Family members should be encouraged to talk to the client in a soft voice with minimal touching.
C) Elevating the head of the bed is important to reducing intracranial pressure but has no effect on stimulation.
D) Raising pads and bedrails is important because of the possibility of seizures but does not relate to stimulation.
E) A dark, quiet room is important to reduce stimuli.

Learning Outcome: 11.6. Analyze independent interventions nurses can implement for patients with alterations in intracranial regulation.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

W W . T B S M . W S

6) The nurse is planning care for an older adult client with a head injury secondary to a motor vehicle crash. Which information should the nurse keep in mind when planning this client's care? **Select all that apply.**
A) Anxiety, illness, and pain can alter the ability to learn.
B) Baseline reflexes may be slower or diminished.
C) Impulse transmission and reactions to stimuli are slower.
D) Neurologic assessment should be completed in a single session.
E) Impairment in vision and hearing should be taken into consideration.
Answer: A, B, C, E
Explanation: A) In the older client, anxiety, illness, and pain can alter the ability to learn.
B) Reflexes may be slower or diminished in an older client.
C) Responses to stimuli are slower because of reduced impulse transmission.
D) For an older client, full neurologic assessment can be lengthy. Conduct the assessment in several sessions, if indicated, and cease the tests if the client is noticeably fatigued.
E) Many older adults have some impairment of hearing and vision, which should be taken into consideration when planning care.
Page Ref: 791
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 11.8. Differentiate considerations related to the assessment and care of patients with alterations in intracranial regulation throughout the lifespan.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

7) A client with a head injury is demonstrating signs of increased intracranial pressure (IICP). Which classifications of medications should the nurse anticipate administering to this client? **Select all that apply.**

A) Osmotic diuretics
B) Antibiotics
C) Antiseizure drugs
D) Histamine H_2 antagonists
E) Antipyretics

Answer: A, C, D, E

Explanation: A) Osmotic diuretics are commonly used to reduce ICP.
B) Antibiotics are not routinely prescribed as treatment for IICP.
C) Antiseizure drugs are often required to manage seizure activity associated with brain injury and IICP.
D) Gastrointestinal prophylaxis with intravenous histamine H_2 antagonists is often used because clients with IICP are at increased risk for developing stress gastritis and ulcers.
E) Antipyretics such as acetaminophen are used alone or in combination with a hypothermia blanket to treat hyperthermia.

Page Ref: 789
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 11.7. Summarize collaborative therapies used by interprofessional teams for patients with alterations in intracranial regulation.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

8) The nurse is performing a neurologic assessment on a 9-year-old child who has displayed unexplained changes in behavior. Which assessment finding is consistent with a neurologic deficit?

A) Child has a negative Babinski reflex.
B) Child recalls names of well-known cartoon characters.
C) Child is able to walk backward heel to toe.
D) Child is incapable of balancing on one foot.

Answer: D

Explanation: A) A positive Babinski reflex is abnormal after the child ambulates or reaches 2 years of age.
B) Ability to recall names of well-known cartoon characters would show a normal level of recall.
C) Children should be able to heel-toe walk backward by 6 years of age.
D) Children should be able to balance on one foot for 5 seconds by 4 years of age.

Page Ref: 790
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Learning Outcome: 11.8. Differentiate considerations related to the assessment and care of patients with alterations in intracranial regulation throughout the lifespan.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

WWW.TBSM.NG

9) The nurse is reviewing the anatomy of the nervous system. Which part of the body should the nurse identify as that which controls reflexes and regulates activities such as vomiting, hiccupping, coughing, and sneezing?

A) Brainstem
B) Hypothalamus
C) Spinal cord
D) Thalamus

Answer: A

Explanation: A) The brainstem is made up of the midbrain, pons, and medulla oblongata. The brainstem controls reflexes and influences all basic life functions including breathing, blood pressure, and heart rate. The brainstem also regulates activities such as vomiting, hiccupping, coughing, and sneezing.

B) The hypothalamus is the autonomic control center, and it is involved in regulating activities such as heart rate, blood pressure, respiratory rate and depth, pain, pleasure, and fear.

C) The spinal cord transmits impulses to and from the brain.

D) The thalamus is the brain's relay center; it takes all incoming nerve impulses and sends those signals to the correct region of the brain.

Page Ref: 769
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 11.1. Analyze the physiology of intracranial regulation.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

10) The nurse is caring for a client recovering from a stroke. Which lobe of the brain should the nurse recall as that which stores memory and interprets auditory stimuli?
A) Frontal
B) Occipital
C) Parietal
D) Temporal
Answer: D
Explanation: A) The frontal lobe is involved with speech, thought, learning, emotion, and voluntary movement.
B) The occipital lobe processes vision.
C) The parietal lobe processes sensory information, including shapes, temperature, pain, and two-point discrimination.
D) The temporal lobe of the brain stores memory and interprets auditory stimuli.
Page Ref: 769
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 11.1. Analyze the physiology of intracranial regulation.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

11) The nurse is reviewing the relationship between the neurologic and respiratory systems. Which alteration should the nurse expect to occur if a client with a decrease in level of consciousness has a decrease in respirations?
A) Acid-base balance
B) Cognition
C) Mobility
D) Oxygenation
Answer: D
Explanation: A) An increase in CO_2 leading to vasodilation and increased intracranial pressure is involved in the relationship between intracranial regulation and acid-base balance.
B) Alterations in intracranial regulation can lead to impaired cognitive function, ranging from mild confusion to lack of consciousness.
C) Clients with alterations in intracranial regulation will have different mobility needs based on the underlying pathology.
D) A decrease in level of consciousness may lead to a decrease in respiration describes the relationship between intracranial regulation and oxygenation.
Page Ref: 779
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 11.3. Outline the relationship between intracranial regulation and other concepts.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

12) The nurse is reviewing the use of protective equipment for outdoor activities and vehicle restraint systems with a group of community members. Which alteration in intracranial regulation will these health promotion activities prevent?

A) Prescription drug side effects
B) Congenital hydrocephalus
C) Stroke
D) Trauma

Answer: D

Explanation: A) Prescription drug side effects is a medical condition that can't be prevented with protective equipment or vehicle restraint systems.

B) Congenital hydrocephalus can cause increased intracranial pressure in infants but is genetic and can't be affected by anticipatory guidance.

C) Stroke is a medical condition that can't be prevented with protective equipment or vehicle restraint systems.

D) Health promotion efforts concerning intracranial regulation that focus on the proper use of protective equipment for outdoor activities and vehicle restraint systems are designed to anticipate and prevent trauma as a cause for alterations to intracranial regulation.

Page Ref: 778
Cognitive Level: Understanding
Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 11.4. Explain the promotion of healthy intracranial regulation.
MNL LO: Analyze the concept of intracranial regulation and its application to nursing care.

Exemplar 11.A Increased Intracranial Pressure

1) A school-age client with a head injury has a heart rate of 48 bmp, blood pressure 132/58 mmHg, and respiratory rate 28 and irregular. Which conclusion should the nurse make?
A) These vital signs indicate respiratory distress.
B) These vital signs indicate increased intracranial pressure.
C) These vital signs indicate cardiovascular disease.
D) These vital signs indicate that this child has a spinal cord injury.
Answer: B
Explanation: A) Respiratory distress is often indicated by a respiratory rate that is lower than normal.
B) These vital signs show a wide pulse pressure (increased systolic blood pressure and lowered diastolic blood pressure), slow heart rate, and respirations that are irregular, all indicating possible significant increased intracranial pressure. Normal heart rate for an awake child at this age is 70-110. Normal blood pressure is 92-126/55-86. Normal respirations are 20 and regular. These vital signs are a sign of increased intracranial pressure.
C) Cardiovascular disease is a chronic condition, not an acute condition that results from trauma.
D) If it was a spinal cord injury, and neurogenic shock weas suspected, the child would be hypotensive.

Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Identify the clinical manifestations of increased ICP.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

WwW.TeSM.Ws

2) The nurse is caring for a client being monitored for increased intracranial pressure (IICP). Using the Monro-Kellie hypothesis as a basis for explanation, which comment by the nurse to the client's family would be most appropriate?
A) "It is normal for brain pressure to increase in times of stress."
B) "Increasing brain pressure decreases the amount of blood flow to the brain itself."
C) "The pressure in the brain is increasing because the brain is shrinking."
D) "Because there is more pressure in the brain, the blood flow is also increasing."
Answer: B
Explanation: A) It is not normal for brain pressure to increase in times of stress.
B) The Monro-Kellie hypothesis states that a dynamic equilibrium exists among the three components (brain, cerebrospinal fluid, and blood) of the skull. A change in the volume of any component risks a decrease in the remaining components to maintain normal intracranial pressures.
C) The pressure in the brain does not increase because the brain in shrinking.
D) Increased pressure in the brain does not increase blood flow to the brain.
Page Ref: 793
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Describe the pathophysiology of increased ICP.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

3) A school-age client is being discharged after receiving a ventriculoperitoneal (VP) shunt as treatment for increased intracranial pressure (ICP). Which statement should indicate to the nurse that teaching provided to the parents about shunt malfunction has been effective?
A) "If our child has a bulging soft spot, we will call the doctor."
B) "If our child develops an altered level of consciousness, we will notify the doctor."
C) "If we notice our child's head is expanding, we will notify the doctor."
D) "If our child vomits, we will call the doctor."
Answer: B
Explanation: A) Because the bones in the skull have not yet fused, an infant with increased ICP may have bulging fontanels, separated sutures on the skull, drowsiness, or vomiting. In most children by age 8, the cranial suture lines have fused and the fontanels are closed, so a bulging soft spot would not be a common symptom of shunt malfunction and an increase in intracranial pressure.
B) An altered level of consciousness would be a symptom of shunt malfunction and increasing intracranial pressure.
C) In most children by age 8, the cranial suture lines have fused and the fontanels are closed, so an expanding head size would not be a common symptom of shunt malfunction and an increase in intracranial pressure.
D) In children, and as ICP increases in infants, the signs and symptoms of increased ICP present similarly to adults. Examination may reveal headaches, weakness, eye movement disturbances, behavioral changes, decreased level of consciousness (LOC), or seizures.

Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Differentiate care of patients with increased ICP across the lifespan.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

4) The nurse identifies the problem of a risk for infection for a child who sustained a brain injury during an automobile accident. Which intervention would be appropriate to include in this client's plan of care related to this problem?

A) Teach the family the importance of using seat belts.

B) Change the client's dressings on a prescribed basis.

C) Refer the family to support services in the community.

D) Explain rules for visiting in the Intensive Care Unit.

Answer: B

Explanation: A) While families may need education about seat belts, it is not the optimal time to implement such teaching at this point in the crisis.

B) A nursing intervention that would support the problem risk for infection would be changing the client's dressings on a prescribed basis because wet dressings can be a source of infection.

C) While families may need education about sources of support, it is not the optimal time to implement such teaching at this point in the crisis.

D) Timelines for visitation are appropriate but are not the priority.

Page Ref: 797

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Apply the nursing process in providing culturally competent care to an individual with increased ICP.

MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

5) While caring for a client with increased intracranial pressure (ICP), a family member asks to assist. Which interventions are appropriate for the nurse to teach the family member regarding this client's care? **Select all that apply.**
A) Maintain head of the bed elevated to 30 degrees.
B) Position client in a supine position.
C) Decrease stimuli.
D) Keep bedrails raised.
E) Keep the client in a stationary position.
Answer: A, C, D
Explanation: A) For clients with increased ICP, the head of the bed should be elevated. The degree depends on the reaction of the client to the position; 30 degrees is usually appropriate, but this can vary by the client.
B) The head of the bed should be elevated. The degree depends on the reaction of the client to the position.
C) Decrease stimuli for a client with increased ICP.
D) For clients with increased ICP, the bedrails should be raised.
E) Clients with increased ICP must not remain stationary, but position changes should be done less frequently than for other clients because turning, skin care, and passive range of motion exercises can elicit posturing, which also causes increased ICP.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: IX.3. 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with increased ICP.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

6) The nurse is providing care for a client with a head injury and wants to decrease the client's risk for developing increased intracranial pressure (IICP). Which assessment data indicates that the nurse is successful?

A) Body temperature elevated 1 degree in 4 hours
B) Absent gag reflex
C) Pupils equal and reactive to light
D) Sluggish response to verbal stimuli

Answer: C

Explanation: A) An elevated temperature with increased oxygen consumption further increases ICP.

B) Pressure on the brainstem may compromise the function of protective mechanisms such as the gag reflex.

C) Pupillary responses mirror the status of the midbrain and pons.

D) A sluggish response to verbal stimuli could indicate increasing ICP.

Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Apply the nursing process in providing culturally competent care to an individual with increased ICP.

MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

7) The nurse is caring for a pregnant client with a history of idiopathic intracranial hypertension (IIH) and optic neuritis. Which outcome should the nurse least assume regarding this client?
A) The client will deliver her baby via cesarean birth.
B) Pregnancy-related weight gain should be kept to no more than 9 kg.
C) The client has been prescribed a medication to treat the IIH.
D) The second stage of labor should not be prolonged.
Answer: A
Explanation: A) Pregnant clients with IIH usually have a normal vaginal delivery.
B) For these women, it is recommended that pregnancy-related weight gain be on the lower end (5-9 kg).
C) Medications to treat IIH can usually be taken throughout pregnancy.
D) If there is optic nerve dysfunction, the second stage of labor should not be prolonged, but otherwise no special care must be provided to the pregnant client with IIH.
Page Ref: 756
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Differentiate care of patients with increased ICP across the lifespan.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

8) The nurse is planning care for a client who is experiencing increased intracranial pressure (ICP) secondary to a head injury sustained during a motor vehicle crash. Which intervention is a priority for this client?
A) Ensuring adequate oxygenation
B) Maintaining a calm environment
C) Monitoring for nausea and vomiting
D) Controlling pain
Answer: A
Explanation: A) Ensuring adequate oxygenation to support brain function is the most important step in management of increased ICP.
B) A calm environment is secondary to maintaining adequate oxygenation.
C) Monitoring for nausea and vomiting (a sign of increased ICP) would be secondary to maintaining adequate oxygenation.
D) Pain control would be secondary to maintaining adequate oxygenation.
Page Ref: 798
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with increased ICP.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

9) The nurse is reviewing the physiology of the central nervous system. Which substance will the nurse identify that is imbalanced and causes hydrocephalus?

A) Blood
B) Cerebrospinal fluid
C) Oxygen
D) Water

Answer: B

Explanation: A) Hydrocephalus is not caused by an imbalance between production and absorption of blood.

B) Hydrocephalus results from an imbalance between production and absorption of cerebrospinal fluid (CSF) which causes too much CSF to accumulate in the brain and the ventricles to widen.

C) Hydrocephalus is not caused by an imbalance between production and absorption of oxygen.

D) Hydrocephalus is not caused by an imbalance between production and absorption of water.

Page Ref: 792

Cognitive Level: Remembering

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Describe the etiology of increased ICP.

MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

10) The nurse is teaching a group of adolescents on general safety. Which adverse outcome can be prevented if the nurse recommends the use of seat belts and to avoid mobile device use while driving?
A) Cerebral edema
B) Head trauma
C) Hydrocephalus
D) Intracranial tumors
Answer: B
Explanation: A) Guidance related to wearing seat belts and avoiding mobile device use while driving will not prevent the development of cerebral edema.
B) Guidance related to wearing seat belts and avoiding mobile device use while driving is intended to lower the risk of head trauma.
C) Guidance related to wearing seat belts and avoiding mobile device use while driving will not prevent the development of hydrocephalus.
D) Guidance related to wearing seat belts and avoiding mobile device use while driving will not prevent the development of intracranial tumors.
Page Ref: 793
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Compare the risk factors and prevention of increased ICP.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

11) The nurse is reviewing autoregulation in the brain. Which events are associated with the loss of autoregulation?
A) Both intracranial pressure and cerebral perfusion decrease.
B) Both intracranial pressure and cerebral perfusion increase.
C) Intracranial pressure decreases and cerebral perfusion increases.
D) Intracranial pressure increases and cerebral perfusion decreases.
Answer: D
Explanation: A) Intracranial pressure and cerebral perfusion do not decrease in autoregulation.
B) Intracranial pressure and cerebral perfusion do not increase in autoregulation.
C) Intracranial pressure does not decrease and cerebral perfusion does not increase in autoregulation.
D) With loss of autoregulation, ICP continues to increase and cerebral perfusion decreases. Cerebral tissue becomes ischemic, and manifestations of cellular hypoxia appear.
Page Ref: 792
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Identify the clinical manifestations of increased ICP.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

12) The nurse is caring for a client who is demonstrating signs of increased intracranial pressure (ICP). Which information about the Monro-Kellie hypothesis should the nurse recall when planning this client's care?
A) An imbalance in the volumes of the brain, blood, and cerebrospinal fluid (CSF) will trigger a compensatory response.
B) Normal intracranial pressure requires that the volumes of the brain, blood, and CSF are low.
C) The brain can compress dynamically to compensate for an increase in blood or CSF volume.
D) The volume of the blood must remain constant regardless of the volume of the brain and CSF.
Answer: A
Explanation: A) In adults, the rigid cranial cavity created by the skull is normally filled to capacity with three essentially noncompressible elements: the brain, cerebrospinal fluid, and blood. A state of dynamic equilibrium exists: If the volume of any of the three components increases, the volume of the others must decrease to maintain normal pressures in the cranial cavity. This relationship is known as the Monro-Kellie hypothesis.
B) Normally either the blood or CSF would shift out of the cranium to compensate for increased volume of one of these three components.
C) The brain is noncompressible.
D) The volume of these components must remain in balance, not be low.
Page Ref: 792

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 11.A. Analyze increased intracranial pressure (ICP) as it relates to intracranial regulation. Describe the pathophysiology of increased ICP.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with increased intracranial pressure.

WwW.TbSm.Ng

Exemplar 11.B Seizure Disorders

1) The nurse observes a school-age client have an absence seizure. Which statement will the nurse likely include when documenting this seizure?

A) "Reported experiencing tingling sensations but denied loss of consciousness."

B) "Became unconscious, and all four extremities were jerking uncontrollably for 2 minutes."

C) "Repeatedly moved from the chair to the bed while touching the arms for a length of 2 minutes."

D) "Sat very still and was unresponsive with a blank stare for 30 seconds."

Answer: D

Explanation: A) During a simple partial seizure, if the sensory portion of the cortex is involved, manifestations may include abnormal sensations such as tingling, numbness, or hallucinations, but there is no alteration in consciousness.

B) Loss of consciousness and jerking of extremities is characteristic of tonic-clonic seizures.

C) Aimless activity may happen during complex partial seizures.

D) Absence (petit mal) seizures are characterized by sudden, brief cessation of all motor activity accompanied by a blank stare and unresponsiveness. These seizures are more common in children than in adults.

Page Ref: 801

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. WwW.TeSm.Ws

Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Identify the clinical manifestations of seizure disorders.

MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

2) A preschool-age client with myoclonic seizures has been following a ketogenic diet for the last 6 months to reduce seizure activity and is complaining of left-sided lower abdominal pain. Which complication of the ketogenic diet should the nurse suspect the client is experiencing?
A) Bowel obstruction
B) Kidney stone
C) Urinary tract infection
D) Appendicitis
Answer: B
Explanation: A) A ketogenic diet does not typically cause bowel obstructions, but it can cause constipation.
B) Renal calculi, or kidney stones, are seen in 5% of children on a ketogenic diet.
C) Urinary tract infections are not a result of a ketogenic diet.
D) Appendicitis does not occur as a result of the ketogenic diet.
Page Ref: 807
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Differentiate care of patients with seizure disorders across the lifespan.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

3) The nurse provides teaching about phenytoin (Dilantin) to the mother of a school-age client with a seizure disorder. Which statement made by the mother indicates that teaching has been effective?
A) "I will give the medicine on an empty stomach so it will absorb better."
B) "I will check the gums and increase visits to the dentist."
C) "I will use a carbonated beverage to dilute the medication."
D) "I will allow the tablet to be chewed."
Answer: B
Explanation: A) There is no dietary recommendation for taking phenytoin (Dilantin).
B) Client teaching for school-age and adolescent clients taking phenytoin (Dilantin) is to discuss the importance of regular dental care because of phenytoin's effects on the gingiva. Gingival hyperplasia can occur in clients who take phenytoin (Dilantin).
C) Carbonated beverages should not be used to dilute medication doses.
D) Unless the medication is prescribed as chewable, the client should not be permitted to chew the dose.
Page Ref: 808
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Differentiate care of patients with seizure disorders across the lifespan.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

4) The nurse identifies the problem of risk for trauma as appropriate for a client with a seizure disorder. Which actions will the nurse take when this client experiences a seizure? **Select all that apply.**
A) Turn the client to a lateral position, if possible.
B) Stay with the client.
C) Insert a tongue blade into the client's mouth.
D) Call for help.
E) Restrain the client.
Answer: A, B, D
Explanation: A) If possible, the client should be turned onto the lateral position, not supine, to allow for any secretions to drain out of the mouth.
B) The nurse should stay with the client.
C) Research has found that more injury can occur to the client if the caregiver tries to place something in the mouth during the seizure than if the caregiver does not.
D) The nurse should call for assistance, if needed.
E) A client should never be restrained during a seizure.
Page Ref: 809
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Apply the nursing process in providing culturally competent care to individuals with seizure disorders.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

WwW.TeSM.Us

5) The nurse is planning discharge teaching for a child with epilepsy who is prescribed phenytoin (Dilantin). Which nutrient should the nurse recommend the client increase in the diet?
A) Carbohydrates
B) Fats
C) Protein
D) Calcium
Answer: D
Explanation: A) Clients on prolonged antiseizure drug therapy do not need to increase the intake of carbohydrates.
B) Clients on prolonged antiseizure drug therapy do not need to increase the intake of fats.
C) Clients on prolonged antiseizure drug therapy do not need to increase the intake of protein.
D) Phenytoin can contribute to demineralization of bone. The serum calcium level should be monitored and calcium supplements may be required.
Page Ref: 806
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a seizure disorder.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

6) The nurse visits the home of an adolescent being treated for a tonic-clonic seizure disorder. Which observations indicate that outcomes for care have been achieved? **Select all that apply.**

A) The client is not driving.
B) The client has not had a seizure for 1 month.
C) The client is participating on the school basketball team.
D) The client has bruises on both arms.
E) The client is complaining of constipation.

Answer: A, B, C

Explanation: A) For a client with a tonic-clonic seizure disorder, driving privileges will be suspended until seizure activity is controlled and client is seizure-free for a period of time determined by state statutes, so this client would likely not be able to drive legally until the seizures are controlled for some time.
B) Cessation of seizure activity indicates that medication therapy has been effective.
C) The client's participation in well-supervised sports and activities will likely enhance the client's self-esteem, and it indicates that care has been effective.
D) Physical bruising may indicate that treatment for a seizure disorder has not been effective.
E) Constipation is a complication of a ketogenic diet used to help control seizure activity and would indicate that care has not been effective.

Page Ref: 808
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Apply the nursing process in providing culturally competent care to individuals with seizure disorders.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

7) An older adult client is experiencing a tonic-clonic (grand mal) seizure exceeding 10 minutes in length. Which medication should the nurse prepare to administer to this client?
A) Intramuscular injection of diazepam
B) Intramuscular injection of phenytoin
C) Intravenous diazepam slowly over several minutes
D) Oral administration of gabapentin
Answer: C
Explanation: A) Diazepam may be administered by an IV slowly over several minutes, but not intramuscularly.
B) Phenytoin is administered intravenously for longer term control of seizures.
C) Grand mal, or tonic-clonic, seizure requires prompt management if it continues after 10 minutes has elapsed. Diazepam may be administered by an IV slowly over several minutes.
D) Gabapentin is an antiseizure drug used to prophylactically reduce or control seizure activity; gabapentin is administered orally 2 hours after antacids, which would be inappropriate for this client.
Page Ref: 804
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a seizure disorder.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

8) A toddler-age client having a tonic-clonic (grand mal) seizure has the jaws clamped shut. Which action should the nurse take?
A) Place a tongue blade between the child's jaws.
B) Restrain the child to prevent injury.
C) Prepare the suction equipment.
D) Stay with the child to observe for complications.
Answer: D
Explanation: A) Be sure nothing is placed in the child's mouth during a seizure.
B) The child should not be restrained during a seizure.
C) Suction equipment should already be set up at the bedside before a seizure begins.
D) During a seizure, the nurse remains with the child, watching for complications.
Page Ref: 809
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 5.2 Contribute to a culture of patient safety. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Apply the nursing process in providing culturally competent care to individuals with seizure disorders.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

9) The nurse is reviewing the different types of seizures. Which type of seizure should the nurse identify as one that does not affect memory or awareness and occurs when abnormal electrical activity is contained to a limited area of the brain?
A) Absence
B) Atonic
C) Generalized
D) Focal
Answer: D
Explanation: A) An absence seizure is a generalized seizure that involves a brief cessation of all motor activity accompanied by blank stare and unresponsiveness.
B) Atonic seizures cause loss of muscle control, which often leads to the individual falling and therefore secondary injuries may occur.
C) A generalized seizure is caused by abnormal electrical discharges that originate from both hemispheres of the brain.
D) Focal seizures (also known as partial seizures) occur when abnormal electrical activity is contained to a limited area of the brain.
Page Ref: 800
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Describe the pathophysiology of seizure disorders.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

10) A client is diagnosed with a seizure disorder that is not provoked by known stimuli. In which way should the nurse categorize this seizure disorder?
A) Acquired
B) Congenital
C) Febrile
D) Idiopathic
Answer: D
Explanation: A) An acquired seizure may be caused by underlying pathologic conditions such as trauma, infection, hypoglycemia, hypotonic dehydration, electrolyte imbalance, endocrine dysfunction, toxins, tumors, or lesions that may be manifested at any time.
B) Congenital is not a type of seizure.
C) Febrile seizures usually occur in children as the result of a rapid temperature rise above 102.2°F (39°C, rectal), often in association with an acute illness.
D) An idiopathic seizure is not provoked by known stimuli.
Page Ref: 801

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Describe the etiology of seizure disorders.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

11) A client with a seizure disorder asks what a seizure threshold is. Which response should the nurse make?
A) The threshold is the length of time a seizure will last.
B) The threshold is the limit beyond which the occurrence of a seizure is possible.
C) Unless a seizure results in convulsions, it is considered to be below the threshold.
D) When the threshold is exceeded, a seizure is considered to be generalized.
Answer: B
Explanation: A) A seizure threshold is not the length of time a seizure will last.
B) Everyone has a seizure threshold. When this threshold is exceeded, a seizure may occur.
C) The presence of convulsions does not determine whether the threshold has been exceeded.
D) A seizure threshold is not a way of classifying seizures as generalized.
Page Ref: 801
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 11.B. Analyze seizure disorders as they relate to intracranial regulation. Compare the risk factors and prevention of seizure disorders.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with seizure disorder.

12) The nurse is preparing a teaching tool about seizure disorders. Which characteristic about seizure triggers should the nurse include?
A) Externalized
B) Generalized
C) Internalized
D) Variable
Answer: D
Explanation: A) A trigger is not externalized if it is an internal condition or internalized if it is an external factor, but different individuals may have different triggers or none at all.
B) General triggers include fatigue, hypoglycemia, fever, alcohol, hyperventilation, and menstruation. Individuals who are able to identify triggers may succeed in reducing their frequency.
C) A trigger is not externalized if it is an internal condition or internalized if it is an external factor, but different individuals may have different triggers, or none at all.
D) Individuals with epilepsy often experience seizure activity upon exposure to a trigger. Triggers may be individualized (e.g., odors, flashing lights). Different individuals may have different triggers, or none at all.

Exemplar 11.C   Traumatic Brain Injury

1) A client is diagnosed with a traumatic brain injury. Which pathophysiologic reason will the nurse expect to assess in this client for this condition?
A) Congenital disorder
B) External force
C) Infection
D) Stress reaction
Answer: B
Explanation: A) Traumatic injury is not congenital.
B) Traumatic brain injury occurs when an external force causes some degree of impairment to brain structure or function. The damage caused by this external force is referred to as the primary injury.
C) Traumatic brain injury occurs when an external force causes some degree of impairment to brain structure or function. The damage caused by this external force is referred to as the primary injury. Traumatic injury does not follow from an infection.
D) Traumatic injury is not caused by stress.
Page Ref: 812

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 11.C. Analyze traumatic brain injury as it relates to intracranial regulation. Describe the pathophysiology of traumatic brain injury.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with traumatic brain injury.

2) The nurse is planning teaching on prevention of traumatic brain injury. Which client is least likely to experience this type of injury?
A) A 2-year-old child
B) A 13-year-old adolescent
C) A 44-year-old office worker
D) A 77-year-old retiree
Answer: C
Explanation: A) Children, especially children under the age of 4, are at increased risk for TBI due to falls or abuse.
B) Adolescents and young adults are at increased risk for TBI due to interpersonal violence and sports.
C) The office worker is not in a professional occupation involving a high risk of physical impact and so would not be in a higher-risk group for TBI.
D) Older adults are at increased risk for TBI due to falls, which are usually related to sensory perception changes or medication side effects.
Page Ref: 814
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Learning Outcome: 11.C. Analyze traumatic brain injury as it relates to intracranial regulation. Compare the risk factors and prevention of traumatic brain injury.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with traumatic brain injury.

3) A client is diagnosed with a mild concussion. Which finding will the nurse expect to assess in this client?
A) Bleeding in the brain
B) Difficulty breathing
C) Acute headache
D) Prolonged unconsciousness
Answer: C
Explanation: A) Bleeding in the brain is associated with a moderate to severe traumatic brain injury.
B) Difficulty breathing is associated with a moderate to severe traumatic brain injury.
C) Acute headache is a clinical manifestation of a mild concussion or traumatic brain injury.
D) Prolonged unconsciousness is associated with a moderate to severe traumatic brain injury.
Page Ref: 814

Learning Outcome: 11.C. Analyze traumatic brain injury as it relates to intracranial regulation. Identify the clinical manifestations of traumatic brain injury.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with traumatic brain injury.

4) The nurse is caring for a client with a traumatic brain injury. For which reason should the nurse expect the client to be evaluated for cerebral edema or ischemia?
A) It often causes a skull fracture.
B) It is an example of a lacerating injury.
C) It is an example of a penetrating injury.
D) It is often secondary to a traumatic brain injury.
Answer: D
Explanation: A) Cerebral edema or ischemia might follow skull fracture but would not cause it.
B) Neither is an example of a lacerating injury.
C) Neither is an example of a penetrating injury.
D) Secondary injuries can be caused by intracranial damage or systemic insults to the brain. Some examples of secondary injuries include cerebral ischemia, cerebral edema, increased intracranial pressure (IICP), infection, hypoxia, hypotension, fever, and hyponatremia.
Page Ref: 813

Learning Outcome: 11.C. Analyze traumatic brain injury as it relates to intracranial regulation. Describe the pathophysiology of traumatic brain injury.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with traumatic brain injury.

5) The nurse is creating a teaching tool about traumatic brain injuries. Which types of sports should the nurse include that are most likely to cause this injury?
A) Competitive
B) Energetic
C) High-impact
D) Team
Answer: C
Explanation: A) Competitive sports do not have to be high-impact.
B) Energetic sports do not have to be high-impact.
C) High-impact and extreme sports such as boxing, football, hockey, and skateboarding carry a higher risk of concussion and TBI.
D) Team sports might be competitive and energetic without being high impact.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 11.C. Analyze traumatic brain injury as it relates to intracranial regulation. Describe the etiology of traumatic brain injury.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with traumatic brain injury.

6) A client is classified as Grade 4 for risk of cerebral vasospasm because of intracerebral clotting and absence of blood in the basal cisterns. Which diagnostic test should the nurse expect to be prescribed to assess intracerebral hemorrhage and grade cerebral vasospasms?
A) Cerebrospinal fluid (CSF) analysis
B) CT scan
C) MRI
D) Transcranial Doppler
Answer: D
Explanation: A) Any clear fluid that leaks from the client's nose or ears should be assessed for CSF (glucose will be present) because this may be indicative of a basilar skull fracture.
B) A CT scan is vital to the diagnosis of traumatic brain injury (TBI) because it can detect the presence and location of skull fractures, contusions, hematomas, hemorrhage, and other brain damage.
C) MRI scans are beneficial for providing more detailed brain images, including axonal injury, once the client is stabilized.
D) Transcranial Doppler may be indicated for intracerebral hemorrhage and is especially useful with grading cerebral vasospasms that may accompany a subarachnoid hemorrhage.
Page Ref: 817
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 11.C. Analyze traumatic brain injury as it relates to intracranial regulation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with traumatic brain injury.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with traumatic brain injury.

7) The nurse is reviewing the types of injuries in infants caused by abuse. Which traumatic brain injury (TBI) is least caused by child abuse?

A) Contusion sustained from fall from high chair

B) Contusion, unknown cause

C) Diffuse axonal injury following involvement as passenger in a vehicle collision

D) Diffuse axonal injury, unknown cause

Answer: C

Explanation: A) The fall from a high chair could have happened accidentally or have been caused to happen, and either a contusion or a diffuse axonal injury could be the result of abuse.

B) A toddler who suffers a fall may have a local contusion with edema from a coup-contrecoup injury.

C) A diffuse axonal injury following involvement in a vehicle collision, however, is most likely the result of the collision.

D) An infant who suffers a TBI from shaken baby syndrome will exhibit diffuse axonal injury.

Page Ref: 818

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 11.C. Analyze traumatic brain injury as it relates to intracranial regulation. Differentiate care of patients with traumatic brain injury across the lifespan.

MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with traumatic brain injury.

8) The school nurse is teaching a group of adolescent athletes about reducing the risk for sustaining traumatic brain injuries (TBI). Which information should the nurse include in the teaching session?
A) "A fall from even a low height can cause traumatic brain injury."
B) "A traumatic brain injury can occur to anyone from a wide range of causes."
C) "If you are injured in a game or practice, don't play through the pain."
D) "Wearing seat belts can protect against injuries in motor vehicle collisions."
Answer: C
Explanation: A) A fall does not specifically address the prevention challenges for TBIs that adolescents present.
B) Explaining that traumatic brain injuries can occur to anyone from a wide range of causes does not specifically address the prevention challenges for TBIs that adolescents present.
C) Adolescents often downplay their injuries or do not report them for fear of looking weak or being unable to participate in sports and other activities. This greatly increases their risk of being injured again and developing second impact syndrome, which can be fatal.
D) Wearing seat belts does not specifically address the prevention challenges for TBIs that adolescents present.
Page Ref: 818
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 11.C. Analyze traumatic brain injury as it relates to intracranial regulation. Differentiate care of patients with traumatic brain injury across the lifespan.
MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with traumatic brain injury.

9) A client presents with a mild concussion following a fall. Which problem is least likely applicable for this client?
A) Acute pain
B) Acute confusion
C) Nausea
D) Risk for post-trauma syndrome
Answer: D
Explanation: A) A client with a mild concussion following a fall might present with acute pain.
B) A client with a mild concussion following a fall might present with acute confusion.
C) A client with a mild concussion following a fall might present with nausea.
D) A client with a mild concussion following a fall is not likely to experience post trauma syndrome.
Page Ref: 820
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 11.C. Analyze traumatic brain injury as it relates to intracranial regulation. Apply the nursing process in providing culturally competent care to an individual with traumatic brain injury.

MNL LO: Demonstrate understanding of the concept of intracranial regulation in the care of a patient with traumatic brain injury.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e **(Pearson)**

Module 12 Metabolism

The Concept of Metabolism

1) The nurse is assessing a client. Which findings indicate a potential problem related to adrenal medulla function? **Select all that apply.**
A) Heart rate of 104
B) Weight decreased 10 lb since previous appointment
C) Respiratory rate of 22
D) Dry and cracked heels
E) Blood pressure of 132/84
Answer: A, B, C, E
Explanation: A) The adrenal medulla secretes the catecholamines epinephrine and norepinephrine. These hormones stimulate the heart.
B) The adrenal medulla secretes the catecholamines epinephrine and norepinephrine. These hormones increase metabolism.
C) The adrenal medulla secretes the catecholamines epinephrine and norepinephrine. These hormones increase respiration.
D) Dry and cracked heels are not caused by changes in adrenal medulla function.
E) The adrenal medulla secretes the catecholamines epinephrine and norepinephrine. These hormones constrict blood vessels which affects blood pressure.
Page Ref: 828
Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.1. Analyze the physiology of metabolism in the body.
MNL LO: Analyze the concept of metabolism and its application to nursing care.

2) The nurse is assessing the vital signs of a client experiencing hypoparathyroidism. While monitoring the blood pressure, the nurse notes the client's hand begins to spasm. Which term is appropriate for the nurse to use when documenting this assessment finding?
A) Trousseau sign
B) Chvostek sign
C) Turner sign
D) Cullen sign
Answer: A
Explanation: A) Trousseau sign is elicited when placing a blood pressure cuff on the arm; when the cuff is inflated, the client experiences carpal spasms.
B) Chvostek sign is elicited by tapping on the face in front of the ear and observing for contractions of the muscle.
C) Turner sign is associated with retroperitoneal bleeding.
D) Cullen sign is associated with retroperitoneal bleeding.
Page Ref: 842
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.5. Differentiate common assessment procedures and tests used to examine metabolism.
MNL LO: Analyze the concept of metabolism and its application to nursing care.

3) While performing an endocrine assessment on a client suspected of having an endocrine disorder, the nurse asks if the client has experienced recent weight changes. On which endocrine glands will the nurse focus an assessment because of being related to weight changes? **Select all that apply.**
A) Gonads
B) Pituitary
C) Thyroid
D) Adrenal
E) Parathyroid
Answer: B, C, D
Explanation: A) The gonads influence estrogen and androgens.
B) The client might gain weight with a pituitary disorder. The pituitary gland controls antidiuretic hormone (ADH), which influences water absorption by the renal tubules.
C) The client might gain weight with thyroid disease such as hypothyroidism or hyperthyroidism.
D) The client might gain weight with an adrenal disorder such as Cushing disease.
E) The parathyroid gland regulates calcium and phosphorus.
Page Ref: 827, 831, 833
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.2. Differentiate alterations in metabolism.
MNL LO: Analyze the concept of metabolism and its application to nursing care.

4) The nurse is reviewing the laboratory test results for a client with an endocrine disorder. Which diagnostic tests would the nurse anticipate reviewing for this client? **Select all that apply.**

A) Prothrombin time
B) Serum albumin
C) Ammonia level
D) Liver enzymes
E) T3 and T4 levels

Answer: B, D, E

Explanation: A) Prothrombin time does not specifically assess the structure and function of the endocrine glands.

B) Specific diagnostic tests to assess the structure and function of the glands of the endocrine system include serum albumin.

C) Serum ammonia does not assess the structure and function of the endocrine glands.

D) Specific diagnostic tests to assess the structure and function of the glands of the endocrine system include liver enzymes such as AST, ALT, SGOT, and LDH.

E) Specific diagnostic tests to assess the structure and function of the glands of the endocrine system include thyroid hormones (T3 and T4).

Page Ref: 842

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 12.5. Differentiate common assessment procedures and tests used to examine metabolism.

MNL LO: Analyze the concept of metabolism and its application to nursing care.

5) An older client is diagnosed with disorders of fat metabolism, reduced absorption of fat-soluble vitamins, and a slightly elevated blood glucose level. Which endocrine organ does the nurse consider that contributes to reduced absorption of fat-soluble vitamins as a normal age-related change?

A) Pituitary
B) Thyroid
C) Pancreas
D) Adrenal medulla

Answer: C

Explanation: A) There is no evidence to support focusing on the pituitary gland.
B) There is no evidence to support focusing on the thyroid gland.
C) Normal age-related changes in pancreatic function include decreased production of lipase, which causes less fat absorption and decreased absorption of fat-soluble vitamins. The pancreas also has decreased insulin release and decreased sensitivity to circulating insulin, which can cause an increase in blood glucose levels in the older adult who does not have diabetes.
D) There is no evidence to support focusing on the adrenal medulla.

Page Ref: 847
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 12.8. Differentiate considerations related to the assessment and care of patients with alterations in metabolism throughout the lifespan.
MNL LO: Analyze the concept of metabolism and its application to nursing care.

6) For clients with a deficiency in any hormone, which teaching is important for the nurse to provide?
A) Increasing fluid intake
B) Decreasing body weight
C) Taking hormone supplements as directed
D) Regulating sugar intake
Answer: C
Explanation: A) Depending on the hormone deficiency, clients may need education related to either increasing or decreasing fluid intake.
B) Depending on the hormone deficiency, clients may need education related to either increasing or decreasing body weight.
C) Clients who have a hormone deficiency require client teaching related to the importance of regularly taking their hormone supplements.
D) Client teaching related to regulating sugar intake is specific for clients with insulin deficiency or insulin resistance, not for any client with a hormone deficiency.
Page Ref: 836
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 12.4. Explain the promotion of healthy metabolism.
MNL LO: Analyze the concept of metabolism and its application to nursing care.

WwW.TeSM.Ws

7) Which intervention can the nurse implement independently to provide support to clients with an alteration in metabolism?
A) Administer hormone therapies.
B) Refer the client to a nutritionist.
C) Order blood tests.
D) Refer the client to an acupuncturist.
Answer: B
Explanation: A) Administering hormone therapies is a collaborative intervention.
B) Many clients with an alteration in metabolism will have special dietary needs, so the nurse can refer the client to a nutritionist or dietitian as an independent nursing intervention.
C) Ordering blood tests is outside the scope of nursing practice.
D) Nurses should not refer the client to an acupuncturist without consulting with a provider who understands the effects of acupuncture on the client's specific metabolic disorder.
Page Ref: 842
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.11. Examine nursing roles in assuring coordination, integration, and continuity of care. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 12.6. Analyze independent interventions nurses can implement for patients with alterations in metabolism.
MNL LO: Analyze the concept of metabolism and its application to nursing care.

8) An alteration in calcium regulation and parathyroid hormone levels is likely to directly affect which other nursing concept related to metabolism?
A) Acid-base balance
B) Reproduction
C) Perfusion
D) Mobility
Answer: D
Explanation: A) Acid-base balance is not directly related to calcium regulation and parathyroid hormone levels.
B) Reproduction is not directly related to calcium regulation and parathyroid hormone levels.
C) Perfusion is not directly related to calcium regulation and parathyroid hormone levels.
D) Mobility and the risk for bone fracture is related to calcium regulation, which is controlled by parathyroid hormone and calcitonin.
Page Ref: 836
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 12.3. Outline the relationship between metabolism and other concepts.
MNL LO: Analyze the concept of metabolism and its application to nursing care.

9) Which endocrine gland disorder could result in an increase in growth of the bones, organs, and muscles?
A) Pituitary gland
B) Thyroid gland
C) Parathyroid glands
D) Adrenal glands
Answer: A
Explanation: A) The pituitary gland is responsible for the secretion of growth hormone. Excess growth hormone secretion can result in gigantism in children, which causes an increase in the growth of the bones, organs, and muscles.
B) The thyroid gland does not secrete growth hormone.
C) The parathyroid glands do not secrete growth hormone.
D) The adrenal glands do not secrete growth hormone.
Page Ref: 827
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.2. Differentiate alterations in metabolism.
MNL LO: Analyze the concept of metabolism and its application to nursing care.

10) A pregnant client was diagnosed with hypothyroidism after the birth of a previous child. Which special considerations should the nurse include when caring for this client?
A) The client may need a change in the dosage of levothyroxine (Synthroid).
B) The client is at higher risk for gestational diabetes.
C) The client may need to add a folic acid supplement to the medication regimen.
D) The client is at higher risk for diabetes insipidus.

Answer: A
Explanation: A) Pregnant clients with preexisting endocrine disorders such as hypothyroidism may need a change in the dosage of hormone replacement therapy during the pregnancy. The nurse should consult with the provider to determine what dose is appropriate for the client.
B) Hypothyroidism does not increase the risk for gestational diabetes.
C) The current recommendation is that all pregnant clients take a folic acid supplement to reduce the risk of neural tube defects.
D) Hypothyroidism does not increase the risk for diabetes insipidus.
Page Ref: 846
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 12.8. Differentiate considerations related to the assessment and care of patients with alterations in metabolism throughout the lifespan.
MNL LO: Analyze the concept of metabolism and its application to nursing care.

Exemplar 12.A Type 1 Diabetes Mellitus

1) The nurse is planning care for a client admitted with diabetic ketoacidosis (DKA). On which actions should the nurse focus for this client's care? **Select all that apply.**
A) Administration of oral glucose
B) Monitoring for fluid volume overload
C) Frequent blood glucose monitoring
D) Intravenous fluid infusions
E) Insulin infusion
Answer: C, D, E
Explanation: A) Oral glucose should not be administered to the client with diabetic ketoacidosis.
B) The client will be dehydrated and most likely will not need treatment for fluid volume overload.
C) For the client experiencing diabetic ketoacidosis, frequent blood sugar monitoring mandates that the client be cared for in an intensive care environment until stabilized.
D) For the client experiencing diabetic ketoacidosis, IV fluids mandate that the client be cared for in an intensive care environment until stabilized.
E) For the client experiencing diabetic ketoacidosis, insulin infusion for treatment mandates that the client be cared for in an intensive care environment until stabilized.
Page Ref: 854
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Identify the clinical manifestations of type 1 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

2) The parent of a 4-year-old child newly diagnosed with type 1 diabetes mellitus is concerned about the child's care needs because of having other children at home who need attention. Which problem should the nurse include when planning this client's care?
A) Anxiety
B) Risk for inadequate coping skills
C) Risk for unstable blood glucose level
D) Ready to improve health maintenance
Answer: B
Explanation: A) There is no evidence that the parent or the client are demonstrating anxiety.
B) The parent is concerned about the client's needs in addition to those of other children. The parent is at risk for inadequate coping with the situation.
C) There is not enough information to determine the status of the client's glucose levels.
D) The client is not demonstrating behaviors that indicate a readiness to improve health maintenance.
Page Ref: 871
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with type 1 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

3) The nurse is finalizing a plan of care for a school-age client newly diagnosed with type 1 diabetes mellitus. Which areas should the plan prioritize to achieve the maximum outcomes for this client? **Select all that apply.**
A) Ways to minimize the number of school days missed
B) Identification and referral to community resources
C) Physical activities that limit exposure to injuries
D) Self-management of glucose monitoring and medications
E) Signs and symptoms of hypoglycemia and actions to take
Answer: B, D, E
Explanation: A) Minimizing the number of school days missed is not an immediate priority for this client's plan.
B) Before discharge, the child and the family should be linked to the resources in the community that will support care of the child with diabetes.
C) Activities that limit exposure to injuries is not an immediate priority for this client's plan.
D) Planning should prepare the child and the family for self-management of glucose monitoring. and medications.
E) Planning should prepare the child and the family for signs and symptoms of hypoglycemia, and actions to take.
Page Ref: 859-861
Cognitive Level: Creating
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care | Nursing Process: Planning
Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with type 1 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

4) The nurse is providing care to a client who is receiving treatment for diabetic ketoacidosis (DKA). Which possible pathophysiologic cause should the nurse identify for the altered metabolism the client is experiencing?
A) Insulin deficiency
B) Decreased gluconeogenesis
C) Excess production of bicarbonate
D) Hypo-osmolarity
Answer: A
Explanation: A) A client who is diagnosed with DKA will experience alterations in metabolism due to an insulin deficiency.
B) Within the pathophysiology of diabetic ketoacidosis, the client will experience increased gluconeogenesis.
C) Within the pathophysiology of diabetic ketoacidosis, the client will experience a loss of bicarbonate.
D) Within the pathophysiology of diabetic ketoacidosis, the client will experience hyperosmolarity.

Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Identify the clinical manifestations of type 1 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

WW.TBSM.WS

5) The client with diabetes mellitus reports having difficulty trimming the toenails because they are thick and ingrown. Which recommendation should the nurse make to this client?
A) Make an appointment with a podiatrist.
B) Offer to file the tops of the nails to reduce thickness after cutting.
C) Cut the nails straight across with a clipper after the bath.
D) Make an appointment with a nail shop for a pedicure.
Answer: A
Explanation: A) The toenails of the client with diabetes require close care. If the nails are thick or ingrown, they require the attention of a podiatrist.
B) The nurse should not file the client's toenails to reduce thickness.
C) Cutting the nails across after the bath is correct for toenails that do not demonstrate the complications listed.
D) The client with diabetes is at an increased risk for infection and should avoid situations in which this risk is increased, such as the nail shop pedicure.
Page Ref: 859
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with type 1 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

6) A client who is newly diagnosed with type 1 diabetes has smoked for 30 years. Which information should the nurse explain about the effects of smoking and diabetes?
A) Contributes to the development of diabetic neuropathy.
B) Increases insulin resistance.
C) Accelerates atherosclerotic changes in blood vessels.
D) Promotes weight gain.
Answer: C
Explanation: A) Poor glycemic control in diabetics is associated with the development of complications including diabetic neuropathy.
B) Smoking does not affect insulin resistance.
C) Smoking is especially unhealthy for diabetic clients because smoking accelerates the atherosclerotic effects that occur in blood vessels from elevated levels of blood glucose.
D) Smoking is not associated with weight gain; in fact, people use weight gain as an excuse not to quit smoking.
Page Ref: 856
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with type 1 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

WW.TBSM.WS

7) A client newly diagnosed with type 1 diabetes mellitus tells the nurse that the diagnosis must be wrong because the client is not overweight, eats all of the time, and is thin. Which response by the nurse is most appropriate?
A) "Thin people can be diabetic, too."
B) "Your condition makes it impossible for you to gain weight."
C) "Your laboratory tests indicate the presence of diabetes."
D) "You are eating large quantities because your condition makes it difficult for your body to obtain energy from the foods taken in."
Answer: D
Explanation: A) While the statement about diabetics being thin is correct, it does not answer the client.
B) It is not impossible for people with diabetes to gain weight.
C) Although the laboratory tests might indicate the presence of diabetes, this does not meet the client's needs for teaching.
D) The client with diabetes is unable to obtain the needed glucose for the body's cells due to the lack of insulin. Clients diagnosed with type 1 diabetes mellitus experience polyphagia and are often thin.
Page Ref: 850
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Identify the clinical manifestations of type 1 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

WwW.TeSM.Ws

8) The destruction of which types of cells in the islets of Langerhans cause type 1 diabetes mellitus?

A) Alpha cells
B) Beta cells
C) Delta cells
D) Gamma cells

Answer: B

Explanation: A) Alpha cells are responsible for the production of glucagon.

B) The beta cells of the islets of Langerhans in the pancreas are the only cells in the body that produce insulin. Destruction of these cells cause type 1 diabetes mellitus.

C) Delta cells produce somatostatin.

D) Gamma cells produce pancreatic polypeptide.

Page Ref: 850

Cognitive Level: Remembering

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Describe the pathophysiology of type 1 diabetes.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

9) Which health promotion and prevention information should the nurse provide about type 1 diabetes?
A) Teaching clients at high risk how to prevent type 1 diabetes
B) Teaching clients with type 1 diabetes how to prevent complications
C) Providing clients with vaccinations against viruses that cause type 1 diabetes
D) Referring clients to a nutritionist and exercise therapist
Answer: B
Explanation: A) Currently, there is no known way to prevent type 1 diabetes.
B) Teaching related to type 1 diabetes should focus on preventing the short- and long-term complications of the disease process.
C) There is no evidence to support a specific virus as causing type 1 diabetes.
D) Nurses may refer clients to a nutritionist or exercise therapist after diagnosis, but proper nutrition or exercise will not prevent type 1 diabetes.
Page Ref: 850
Cognitive Level: Understanding
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | Nursing Process: Implementation
Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Compare the risk factors and prevention of type 1 diabetes.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

10) A client diagnosed with type 1 diabetes since childhood plans to conceive. Which examination should the nurse prepare the woman to have before, during, and after the pregnancy?
A) Gastrointestinal examination for gastric hypotony
B) Neurologic examination for diabetic peripheral neuropathy
C) Eye examination for diabetic retinopathy
D) Renal examination for urinary incontinence
Answer: C
Explanation: A) Older adults are at increased risk for gastric hypotony.
B) Pregnant women with type 1 diabetes are not at increased risk for diabetic peripheral neuropathy compared to other clients with type 1 diabetes.
C) Pregnant women with type 1 diabetes are at an increased risk for diabetic retinopathy. Women with type 1 diabetes who are planning a pregnancy should have eye examinations before the pregnancy, during each trimester, and for 1 year postpartum.
D) Older adults are at increased risk for urinary incontinence related to type 1 diabetes.
Page Ref: 870
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 12.A. Analyze type 1 diabetes mellitus as it relates to metabolism. Differentiate care of patients with type 1 diabetes across the lifespan.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 1 diabetes mellitus.

Exemplar 12.B Type 2 Diabetes Mellitus

1) An older adult client is having a yearly physical examination. Which client statement would indicate a possible diagnosis of diabetes mellitus?
A) "I'm slightly winded when I walk up a flight of stairs, but it passes quickly."
B) "I feel a bit tired by mid-afternoon and take a 30-minute nap most days."
C) "I sometimes have muscle aches in my upper legs at night."
D) "I've been experiencing increased thirst during the past several months."
Answer: D
Explanation: A) Being slightly short of breath after walking up a flight of stairs with a quick recovery may be within the normal functioning of a healthy older client.
B) Fatigue that responds to a short nap may be within the normal functioning of a healthy older client.
C) Having some muscle aches at night may be within the normal functioning of a healthy older client.
D) Excessive thirst can be associated with high glucose levels and may be a symptom of undiagnosed diabetes mellitus.
Page Ref: 877
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Identify the clinical manifestations of type 2 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

2) The nurse is asked why weight loss reduces the risk of developing type 2 diabetes. Which response by the nurse is most appropriate?

A) "Excess body weight impairs the body's release of insulin."

B) "The amount of food taken in by those who are overweight requires more insulin to adequately metabolize, resulting in diabetes."

C) "The physical inactivity associated with obesity causes a reduced ability by the body to produce insulin."

D) "Thin people are less likely to become diabetic."

Answer: A

Explanation: A) Beta cells of the body release insulin. Their actions are hindered as the amount of adipose tissue in the body increases.

B) The amount of food taken in is not the issue as much as the excess body weight. The body does require more insulin with a greater food intake, but that does not necessarily result in diabetes.

C) Inactivity is directly linked to obesity, but it does not present a direct tie to the production of insulin.

D) Thin people can develop type 2 diabetes.

Page Ref: 877

Cognitive Level: Applying

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Compare the risk factors and prevention of type 2 diabetes.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

3) The nurse is planning care for a client with type 2 diabetes mellitus. Which problem would be most appropriate for this client?
A) Inability to provide self-care
B) Potential for impaired tissue integrity
C) Inefficient cardiac perfusion
D) Resistance to learning about the disease process
Answer: B
Explanation: A) There is no evidence that the client is unable to provide self-care.
B) A client with diabetes mellitus is at risk for complications, one being maintaining tissue integrity. This would be the problem most appropriate for the client.
C) There is no evidence that the client has inefficient cardiac perfusion.
D) There is no evidence that the client is resistant to learning about the disease process.
Page Ref: 884
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with type 2 diabetes.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

4) The healthcare provider prescribes sitagliptin (Januvia) for a client with type 2 diabetes mellitus. For which potential side effect should the nurse monitor this client?
A) Elevated blood lipid levels
B) Hyperglycemia
C) Pancreatitis
D) Renal insufficiency
Answer: C
Explanation: A) Sitagliptin (Januvia) does not cause elevated blood lipids.
B) Sitagliptin (Januvia) does not cause hyperglycemia.
C) A potential side effect of sitagliptin (Januvia) is pancreatitis, and the client must be monitored for this.
D) Sitagliptin (Januvia) does not cause renal insufficiency.
Page Ref: 839
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with type 2 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

5) After reviewing the population demographics for an urban community, the nurse determines that community members would benefit from teaching on type 2 diabetes mellitus in children. Which findings support this nurse's conclusion? **Select all that apply.**

A) A large number of community families have both parents diagnosed with type 2 diabetes mellitus.

B) There is low compliance with the annual flu vaccination.

C) Half of the children in the community are African American.

D) A quarter of the children in the community are Hispanic.

E) Most of the children are raised in families where both parents are unemployed.

Answer: A, C, D

Explanation: A) The risk factors for diabetes include having parents with the condition.

B) Frequency of obtaining the annual flu vaccination is not a risk factor for the development of type 2 diabetes in children.

C) Type 2 diabetes is higher in those of the African American population.

D) Type 2 diabetes is high in those of the Hispanic population.

E) Socioeconomic status is not a risk factor for the development of type 2 diabetes in children.

Page Ref: 877

Cognitive Level: Analyzing

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Compare the risk factors and prevention of type 2 diabetes.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

6) What collaborative interventions are likely to improve outcomes for an 11-year-old client diagnosed with type 2 diabetes mellitus? **Select all that apply.**
A) Weaning off oral medications
B) Food intake based on age, sex, and physical activity
C) Obtaining adequate rest and sleep
D) Physical activity to be at least 30 to 60 minutes per day most days of the week
E) Family participation in the lifestyle change
Answer: B, D, E
Explanation: A) The child with type 2 diabetes mellitus will most likely be treated with oral hypoglycemic agents. Weaning off of these medications will not improve the client's long-term prognosis.
B) Plans to improve the client's long-term prognosis should focus on food intake that is based on the client's age, sex, and physical activity.
C) The child with type 2 diabetes mellitus does not have a need for adequate rest and sleep to improve the long-term prognosis.
D) Plans to improve the client's long-term prognosis should focus on obtaining the required physical activity that is recommended for most days of the week.
E) Plans to improve the client's long-term prognosis should focus on family support to comply with lifestyle changes that the client needs.
Page Ref: 882
Cognitive Level: Creating
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Differentiate care of patients with type 2 diabetes across the lifespan.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

7) Which pathophysiologic process causes type 2 diabetes?
A) Excessive insulin production
B) Insulin resistance
C) Inability of the pancreas to produce insulin
D) Impaired insulin uptake
Answer: B
Explanation: A) The level of insulin produced in type 2 diabetes varies; production could be increased or decreased, depending on the client.
B) Type 2 diabetes occurs despite the availability of endogenous insulin, because insulin's functioning is impaired by insulin resistance.
C) The pancreas is able to produce insulin, but the insulin cannot work properly due to insulin resistance.
D) Glucose uptake, not insulin uptake, is impaired in type 2 diabetes.
Page Ref: 877
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Describe the pathophysiology of type 2 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

8) Which potential cause of type 2 diabetes influences insulin's ability to regulate glucose metabolism and uptake by the liver, skeletal muscles, and adipose tissue?
A) Infections
B) Exposure to toxins
C) Young age
D) Obesity
Answer: D
Explanation: A) Infections are known triggers for type 1 diabetes, not type 2 diabetes.
B) Chemical toxins are known triggers for type 1 diabetes, not type 2 diabetes.
C) Older age, not young age, can increase cellular resistance to the effects of insulin and increase the risk of developing type 2 diabetes.
D) In obesity, insulin has a decreased ability to influence glucose metabolism and uptake by the liver, skeletal muscles, and adipose tissue.
Page Ref: 877
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Describe the etiology of type 2 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

9) Which test is commonly used to screen for type 2 diabetes in the general population?
A) Fasting plasma glucose
B) Oral glucose tolerance test
C) Urine ketone levels
D) Serum cholesterol levels
Answer: A
Explanation: A) Tests used to screen for type 2 diabetes in the general population include fasting plasma glucose and glycated hemoglobin (A1C).
B) Oral glucose tolerance tests are primarily used for screening for gestational diabetes in pregnant women, although they can also be used for clients with suspected diabetes.
C) Urine ketone levels and serum cholesterol levels are not used for screening. Urine ketone levels are used primarily to monitor clients with type 1 diabetes.
D) Serum cholesterol levels are measured to assess the risk for cardiovascular disease, which may or may not be related to diabetes.
Page Ref: 879
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with type 2 diabetes.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

10) Which goal would be most appropriate to include in the nursing care plan of a client with type 2 diabetes?
A) The client will record daily fat intake.
B) The client will use hand hygiene when toileting.
C) The client will monitor fasting glucose levels.
D) The client will inspect feet at least once daily.
Answer: D

Explanation: A) Clients with type 2 diabetes should record carbohydrate intake, not fat intake.

B) Teaching proper hand hygiene may be appropriate when teaching clients with diabetes about insulin injections, but teaching hand hygiene when toileting is not specific for clients with type 2 diabetes.

C) Although fasting glucose levels are important, postprandial blood glucose levels provide the most useful information for evaluating glycemic control in clients with type 2 diabetes.

D) Clients with type 2 diabetes are at high risk for foot problems related to diabetic peripheral neuropathy. Therefore, an appropriate goal for clients with type 2 diabetes includes inspecting feet at least once daily.

Page Ref: 884
Cognitive Level: Understanding
Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with type 2 diabetes.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

11) The nurse is caring for a 76-year-old client with type 2 diabetes who is recovering from surgery following a hip fracture. In addition to blood glucose level, which assessment finding should the nurse recognize as a sign of hyperosmolar hyperglycemic state (HHS)?

A) Excessive sweating
B) Increased urine output
C) Insomnia
D) Edema

Answer: B

Explanation: A) Excessive sweating is not a symptom of HHS.

B) Older adults with type 2 diabetes who have undergone a major surgery are at high risk for developing hyperosmolar hyperglycemic state (HHS). Symptoms of HHS include greatly elevated blood glucose levels, high plasma osmolarity, and altered level of consciousness. Other symptoms include increased urine output.

C) Lethargy and not insomnia is a symptom of HHS.

D) HHS leads to dehydration and fluid loss, not edema.

Page Ref: 878

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 12.B. Analyze type 2 diabetes mellitus as it relates to metabolism. Differentiate care of patients with type 2 diabetes across the lifespan.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with type 2 diabetes mellitus.

Exemplar 12.C Liver Disease

1) The nurse is concerned that a client with potential hepatic failure is at risk for developing ascites. Which assessment finding supports the development of liver failure as manifested by ascites?
A) Increased abdominal girth
B) Gallbladder pain
C) Yellow-tinged skin
D) Bleeding and bruising easily
Answer: A
Explanation: A) Ascites is the accumulation of the fluid in the abdomen and is a result of liver failure. The client with ascites would have an increased abdominal girth.
B) Obstructed biliary flow could be the cause of gallbladder pain.
C) Jaundice is manifested as yellow-tinged skin and is the result of hepatic disorders.
D) The client experiencing hepatic problems might have bleeding and bruising issues due to inadequate vitamin K.
Page Ref: 886
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Identify the clinical manifestations of liver disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

2) The nurse is caring for a client who complains of jaundice and pruritus. The healthcare provider suspects that the client has liver disease. Which modifiable risk factor for cirrhosis of the liver might the nurse see in the client's history?
A) Smokes two packs of cigarettes per day
B) Drinks a six-pack of beer each evening
C) History of occupational exposure to hepatic toxins
D) Family history of fatty liver disease
Answer: B
Explanation: A) Smoking is a risk factor for lung disease.
B) Risk factors for the development of cirrhosis of the liver include excessive alcohol intake.
C) Past history of exposure to hepatic toxins may contribute to the risk of liver disease but is not a modifiable risk factor.
D) A family history of fatty liver disease is not a modifiable risk factor.
Page Ref: 888
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Compare the risk factors and prevention of liver disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

3) The nurse is caring for a client who was recently admitted for treatment of cirrhosis. The client is currently experiencing ascites, +3 pitting edema, and oliguria. Which problem should the nurse select as a priority for this client?
A) Fluid volume excess
B) Inadequate peripheral tissue perfusion
C) Insufficient volume of fluid
D) Impaired skin integrity
Answer: A
Explanation: A) The client experiencing ascites, edema, and oliguria should have a care plan for the problem of fluid volume excess.
B) Inadequate peripheral tissue perfusion would be the appropriate diagnosis for a client experiencing cyanosis or tissue necrosis.
C) Hypotension and dry mucous membranes are associated with insufficient volume of fluid.
D) Edema can cause impaired tissue integrity, but there is no evidence of such problems with this client.
Page Ref: 894
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with liver disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

4) The family member of a client with cirrhosis of the liver asks about portal hypertension. Which symptom should the nurse describe to the family member?
A) Muscle wasting
B) Hypothermia
C) Bleeding gums
D) Hemorrhoids
Answer: D
Explanation: A) Muscle wasting is commonly associated with the poor nutritional intake seen in clients with cirrhosis.
B) Hypothermia is an unrelated finding.
C) Bleeding gums indicate insufficient vitamin K production in the liver.
D) Obstruction to portal blood flow causes a rise in portal venous pressure, resulting in splenomegaly, ascites, and engorgement of veins in the esophagus, rectum, and abdomen.
Page Ref: 887
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Identify the clinical manifestations of liver disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

5) The nurse is caring for a client recovering from a liver transplant necessitated by cirrhosis of the liver. Which postoperative outcome would be a priority for this client?
A) Moist membranes of the mouth
B) Normal serum bilirubin levels
C) Ability to move the legs
D) Normal pupil reaction
Answer: B
Explanation: A) Moist mouth membranes is a normal finding in a client recovering from surgery.
B) An indication for liver transplant is increasing bilirubin levels. Normal bilirubin levels after surgery would indicate that the transplanted liver is functioning correctly.
C) Normal leg movement would be expected in a client recovering from surgery.
D) Normal pupil reaction would be expected after surgery.
Page Ref: 891
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with liver disease.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

6) A client with liver cirrhosis begins to drain bright red blood through the nasogastric tube. Which medication should the nurse prepare to administer to this client?
A) Vitamin K
B) Ferrous sulfate
C) Platelets
D) Folic acid
Answer: C
Explanation: A) Vitamin K may be ordered to reduce the risk of bleeding.
B) Ferrous sulfate is used to treat anemia.
C) When bleeding is acute, packed RBCs, fresh frozen plasma, or platelets may be administered to restore blood components and promote hemostasis.
D) Folic acid is used to treat anemia.
Page Ref: 891
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with liver disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

7) The nurse is caring for a client with end-stage liver disease. Which alterations should the nurse anticipate with this client? **Select all that apply.**

A) Elevated serum albumin levels due to increased protein synthesis
B) Decreased clotting factor levels due to impaired clotting factor production
C) Hyperglycemia due to disrupted glucose metabolism
D) Increased serum vitamin K due to impaired clearance of fat-soluble vitamins
E) Increased plasma oncotic pressure due to impaired protein metabolism

Answer: B, C

Explanation: A) Low albumin levels is a finding in end-stage liver disease.
B) Impaired clotting-factor production increases the risk for bleeding.
C) Disrupted glucose metabolism and storage may result in hyperglycemia.
D) Serum vitamin K is decreased due to impaired absorption of fat-soluble vitamins.
E) Low albumin levels contribute to edema in peripheral tissues and ascites (accumulation of fluid in the abdomen), as plasma oncotic pressure is reduced, not increased.

Page Ref: 886

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Describe the pathophysiology of liver disease.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

8) A client with liver disease presents to the hospital with severe ascites. Which pathophysiologic changes does the nurse recognize as contributing to the development of ascites? **Select all that apply.**
A) Presence of portal hypertension
B) Presence of hyperalbuminemia
C) Increased colloidal osmotic pressure
D) Sodium and water retention
E) Presence of hypoaldosteronism
Answer: A, D
Explanation: A) Ascites is the accumulation of plasma-rich fluid in the abdominal cavity. Although portal hypertension is the primary cause of ascites, decreased serum proteins and increased aldosterone also contribute to the fluid accumulation.
B) Hypoalbuminemia (low serum albumin) decreases the colloidal osmotic pressure of plasma.
C) Hypoalbuminemia (low serum albumin) decreases the colloidal osmotic pressure of plasma. This pressure normally holds fluid in the intravascular compartment, but when the plasma colloidal osmotic pressure decreases, fluid escapes into extravascular compartments.
D) Hyperaldosteronism (an increase in aldosterone) causes sodium and water retention, contributing to ascites and generalized edema.
E) Hyperaldosteronism occurs and not hypoaldosteronism.

WwW.TeBSM.Ws

Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Identify the clinical manifestations of liver disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

9) Which condition is caused by restricted blood flow through the liver?
A) Portal hypertension
B) Cirrhosis
C) Jaundice
D) Biliary atresia
Answer: A
Explanation: A) Restricted blood flow through the liver results in portal hypertension, or increased pressure in the portal venous system.
B) Cirrhosis results when functional liver tissue is destroyed and replaced by fibrous scar tissue.
C) Jaundice results from impaired bilirubin conversion and excretion.
D) Biliary atresia is a disorder of the bile ducts that causes backup of bile into the liver, resulting in tissue damage.
Page Ref: 888
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Describe the pathophysiology of liver disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

10) When individuals engage in excessive alcohol consumption, which liver function is impacted, leading to subsequent liver damage?
A) Metabolism
B) Synthesis
C) Detoxification
D) Glycogen storage
Answer: C
Explanation: A) Metabolism of proteins is a normal function of the liver that helps maintain health.
B) Synthesis of albumin and clotting factors is a normal function of the liver that helps maintain health.
C) The liver is responsible for detoxifying alcohol and other substances. If an individual participates in high-risk behaviors such as excessive alcohol consumption, the detoxification function of the liver can be overwhelmed, resulting in damage to the liver.
D) Glycogen storage is a normal function of the liver that helps maintain health.
Page Ref: 886
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.5. Examine common barriers to active involvement of patients in their own health care processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Assessment
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Compare the risk factors and prevention of liver disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

11) Which action should the nurse take to decrease pruritus in a client with liver disease?
A) Vigorously scrub the skin with soap to prevent infection.
B) Apply a lubricant on the skin to prevent dry skin.
C) Use hot water rather than cool water when bathing the client.
D) Administer an antihistamine as needed to reduce itching.
Answer: B
Explanation: A) The skin should not be rubbed, and soap or preparations with alcohol should be avoided.
B) Clients with pruritus require nursing interventions aimed at reducing itching and promoting skin integrity. Emollients or lubricants should be applied as needed to keep the skin moist.
C) Warm water should be used rather than hot water when bathing, because hot water increases pruritus.
D) Antihistamines should be used cautiously because decreased liver function could alter drug responses.
Page Ref: 891, 895
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.6. Describe how the strength and relevance of available evidence influences the choice of interventions in provision of patient-centered care. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Evidence and best practices for nursing. | Nursing Process: Implementation
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with liver disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

12) A 2-week-old infant develops jaundice and clay-colored stools. Which additional finding indicates to the nurse that the client may have biliary atresia?
A) Above average weight gain
B) Increased urine output
C) Abdominal distention
D) Reduced rooting reflex
Answer: C
Explanation: A) The symptoms would result in below average weight gain rather than above average weight gain.
B) Urine should be assessed for color, not volume.
C) Symptoms of biliary atresia usually appear 2 to 3 weeks after birth. They include jaundice, abdominal distention, white or clay-colored stools with putty-like consistency, tea-colored urine, and failure to thrive.
D) Biliary atresia may cause malnutrition due to poor absorption of nutrients, not a reduced rooting reflex.
Page Ref: 893
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Differentiate care of patients with liver disease across the lifespan.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

13) A school-age child is experiencing severe itching, bruising easily, restlessness, and involuntary jerking of the hands. Which organ or system should the nurse anticipate needing to assess further?
A) Liver
B) Nervous system
C) Gastrointestinal tract
D) Urinary system
Answer: A
Explanation: A) Severe itching (pruritus) is common in children with liver cirrhosis. Bruising easily indicates a decreased clotting ability, which could be related to the inability of the liver to produce clotting factors. Restlessness and involuntary jerking of the hands (asterixis) are both signs of portal systemic encephalopathy. All of these symptoms relate to liver disease, particularly cirrhosis. Therefore, a history of infection or disease with liver involvement will be most important to obtain from this client.
B) Infections or diseases of the nervous system would not produce these symptoms.
C) Infections or diseases of the gastrointestinal tract would not produce these symptoms.
D) Infections or diseases of the urinary system would not produce these symptoms.
Page Ref: 893
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 12.C. Analyze liver disease as it relates to metabolism. Differentiate care of patients with liver disease across the lifespan.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with liver disease.

Exemplar 12.D Osteoporosis

1) The nurse is assessing a client who is postmenopausal. Which question should the nurse ask to assess for signs of osteoporosis?
A) "Have you experienced any palpitations?"
B) "Are you having any low back pain?"
C) "Are you having problems with swelling in your feet?"
D) "Is constipation a problem for you?"
Answer: B
Explanation: A) Palpitations do not occur with osteoporosis.
B) A client with osteoporosis will often present with low back pain as well as a decrease in height.
C) Swelling is not an early sign of osteoporosis.
D) Constipation is not an early sign of osteoporosis.
Page Ref: 899
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Identify the clinical manifestations of osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

2) The nurse is conducting a health history on an older adult client. Which assessment finding indicates the client is at risk for osteoporosis?
A) Having a body mass index (BMI) that indicates obesity
B) Using corticosteroids for 10 years because of a chronic lung disorder
C) Eating three to five servings of shrimp and liver per week
D) Drinking three glasses of skim milk daily
Answer: B
Explanation: A) Obesity is not a risk factor for osteoporosis.
B) Long-time use of corticosteroids is a risk factor for developing osteoporosis.
C) A diet rich in shellfish and organ meats is high in purine, which may predispose the client to gout.
D) Skim milk is a good source of calcium and vitamin D, which prevents or slows osteoporosis.
Page Ref: 898
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Compare the risk factors and prevention of osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

3) The nurse is planning care for a female adult client who is high-risk for developing osteoporosis. Which interventions will decrease the client's risk of developing this health problem? **Select all that apply.**

A) Increasing the intake of alcoholic beverages
B) Isometric exercise for at least 30 minutes three times per week
C) Weight-bearing exercises such as walking
D) Having a yearly dual-energy x-ray absorptiometry (DEXA) test
E) A diet with adequate amounts of calcium and vitamin D

Answer: C, E

Explanation: A) Measures to prevent or treat osteoporosis include limiting the intake of beverages containing alcohol.

B) Isometric exercises are not effective against osteoporosis.

C) Interventions that may decrease this client's risk of developing osteoporosis include regular weight-bearing exercise, such as walking, as this activity slows bone loss.

D) A DEXA test measures bone density, but it does not decrease the client's risk for developing osteoporosis.

E) Interventions that may decrease this client's risk of developing osteoporosis include encouraging clients to consume adequate amounts of calcium and vitamin D in their diets to prevent osteoporotic fracture.

Page Ref: 898-899

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

WwW.TeSt.Ws

Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Compare the risk factors and prevention of osteoporosis.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

4) The nurse identifies the problem of inadequate nutrition for a client with osteoporosis. Which client statement indicated to the nurse that this problem was appropriate?
A) "I like to remove all of the fat from the meat I eat."
B) "I am trying to eat a low-carb diet."
C) "I plan to start eating out less."
D) "I am allergic to dairy products."
Answer: D
Explanation: A) Removing fat from meat helps reduce caloric intake but does not address the root cause of osteoporosis.
B) Eating a low-carb diet helps reduce caloric intake but does not address the root cause of osteoporosis.
C) Eating out less helps reduce caloric intake but does not address the root cause of osteoporosis.
D) The client who is allergic to dairy products may not take in much calcium, which increases the risk of osteoporosis, so focusing on diet would be a priority for this client.
Page Ref: 903
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

5) A client asks what can be done to decrease the risk of actually developing osteoporosis. Which intervention would be the most beneficial for this client?
A) Decreasing the amount of calcium in the client's diet
B) Providing the client with assisted range of motion exercising twice daily
C) Increasing regular weight-bearing activities
D) Protecting the client's bones with strict bedrest
Answer: C
Explanation: A) Decreasing calcium intake may potentiate the development of osteoporosis.
B) Assisted range of motion exercises may potentiate the development of osteoporosis.
C) A standard intervention for those attempting to prevent osteoporosis is beginning an exercise plan that includes weight-bearing activities.
D) Strict bedrest may potentiate the development of osteoporosis.
Page Ref: 899
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Compare the risk factors and prevention of osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

6) An adult client with osteoporosis resides in a long-term care facility and has a history of falls and dementia. Which nursing intervention would the nurse take to prevent an injury in this client?
A) Using furniture as obstacles to keep the client in the bed
B) Keeping the bed in the lowest position
C) Keeping a nightlight on in the hallway
D) The use of wrist restraints
Answer: B
Explanation: A) Using the furniture as an obstacle could cause injury if the client is able to get up.
B) Keeping the bed in the lowest position will reduce the incidence of injury should the client attempt to get up.
C) In a long-term care facility, a nightlight should be provided in the room so the client can see to use the restroom.
D) The use of restraints could increase the incidence of injury.
Page Ref: 903
Cognitive Level: Analyzing
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

7) The nurse is providing teaching to a young adult who is at risk for early-onset osteoporosis. Which intervention should the nurse suggest?
A) Stop all physical activity.
B) Reduce the intake of dairy in the diet.
C) Increase intake of calcium and vitamin D.
D) Start estrogen replacement therapy.
Answer: C
Explanation: A) Walking and weight-bearing exercise help prevent osteoporosis, so the client should not stop all physical activity.
B) Dairy is rich in calcium, so reducing intake of dairy is not recommended.
C) An appropriate action for this client is a diet rich in calcium and vitamin D.
D) Due to the client's age, it is not likely that the client needs estrogen replacement therapy at this time.
Page Ref: 898
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Compare the risk factors and prevention of osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

8) A client who is postmenopausal is concerned about the development of osteoporosis and wants to begin preventative activities. Which statement by the nurse is appropriate?
A) "You should first determine if you are at risk for the development of osteoporosis."
B) "After menopause, the decline is too rapid to begin preventative interventions."
C) "Weight-bearing exercise and calcium supplements are helpful in the prevention of osteoporosis."
D) "Hormone replacement therapy should be initiated as soon as possible."
Answer: C
Explanation: A) Although a full analysis would be beneficial, it does not answer the client's request for information.
B) It is not too late to begin prevention activities.
C) Osteoporosis risk factors increase after menopause. Preventative activities include implementing weight-bearing exercise and beginning calcium supplements.
D) Without additional information, it is not possible to determine if the client is a candidate for hormone replacement therapy.
Page Ref: 898
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance

Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Compare the risk factors and prevention of osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

9) The nurse is caring for an older adult client who is taking calcium for the treatment of osteoporosis. Which statements will the nurse include when educating the client about this medication? **Select all that apply.**
A) "The most common adverse effect is hypercalcemia caused by taking too much of the supplement."
B) "Oral calcium supplements are best taken on an empty stomach."
C) "Adults 50 years of age and over should obtain at least 500 to 750 mg per day of elemental calcium."
D) "If you have a condition called ventricular fibrillation, this medication might help."
E) "Report symptoms of weakness, increased urination, and thirst."
Answer: A, E
Explanation: A) The most common adverse effect is hypercalcemia caused by taking too much of the supplement.
B) Oral calcium supplements are best taken with meals or within 1 hour following meals.
C) It is recommended that adults 50 years of age obtain at least 1000 mg per day of elemental calcium and clients over the age of 51 obtain at least 1200 mg per day.
D) Calcium supplementation is contraindicated in clients with ventricular fibrillation.
E) Adverse effects of too much calcium include lethargy, drowsiness, weakness, headache, anorexia, nausea and vomiting, increased urination, and thirst.

Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

WwW.TeSt.Ws

10) The nurse is educating a group of adults about the risks for osteoporosis. Which statements will the nurse include when discussing the use of alcohol and cigarettes? **Select all that apply.**
A) "Smoking decreases nerve supply to the bones."
B) "Nicotine increases calcium absorption, leading to decreased bone density."
C) "Moderate alcohol consumption in postmenopausal women actually may increase bone mineral content."
D) "Alcohol has a direct toxic effect on osteoclast activity, suppressing bone formation."
E) "Heavy alcohol use may be associated with nutritional deficiencies that contribute to osteoporosis."
Answer: C, E
Explanation: A) Smoking decreases the blood supply to bones.
B) Nicotine slows the production of osteoblasts and impairs the absorption of calcium, contributing to decreased bone density.
C) Moderate alcohol consumption in postmenopausal women actually may increase bone mineral content, possibly by increasing levels of estrogen and calcitonin.
D) Alcohol has a direct toxic effect on osteoblast activity, suppressing bone formation during periods of alcohol intoxication.
E) Heavy alcohol use may be associated with nutritional deficiencies that contribute to osteoporosis.
Page Ref: 898
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Compare the risk factors and prevention of osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

11) Which physiological change is the primary cause of loss of height in individuals with osteoporosis?
A) Collapse of vertebral bodies
B) Decrease in length of long bones
C) Flexion of the knees and hips
D) Cervical lordosis
Answer: A
Explanation: A) The loss of height in individuals with osteoporosis occurs primarily as a result of vertebral body collapse.
B) Osteoporosis does not cause a decrease in the length of long bones.
C) The knees and hips flex to help maintain the center of gravity.
D) Osteoporosis contributes to cervical lordosis.
Page Ref: 899
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Identify the clinical manifestations of osteoporosis.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

12) The nurse is caring for an 8-year-old client with cerebral palsy and limited walking ability. The parents are very protective and perform most activities for the child. Which intervention is essential in promoting bone growth and reducing the risk of osteoporosis?
A) Provide client teaching related to using restraints to prevent falls.
B) Provide client teaching related to assistive devices to encourage walking.
C) Refer the client to a dietitian to increase calcium and vitamin D intake.
D) Refer the client to an occupational therapist to increase limb movement.
Answer: B
Explanation: A) Appropriate restraints may be required to prevent falls for clients with cerebral palsy who do not have adequate body control. However, use of restraints will not increase bone growth in these clients.
B) The most effective way to prevent osteoporosis is to perform weight-bearing activities and exercise. The client has limited walking ability rather than complete paralysis, so with practice, help from parents, and the appropriate use of assistive devices, the child could learn to walk independently. This would help stimulate bone growth.
C) The nurse can inform the client and parents about the importance of calcium and vitamin D in the diet without referral to a dietitian.
D) The nurse may need to refer the client to a physical therapist, not an occupational therapist, to help teach the client to walk independently.
Page Ref: 902
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Differentiate care of patients with osteoporosis across the lifespan.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

13) A pregnant client asks about the risk of developing osteoporosis because the fetus is using calcium from the client's body. Which response should the nurse make?
A) "You may lose small amounts of bone mass with each pregnancy, but if you only have one child, the bone loss should not be significant enough to cause osteoporosis."
B) "When bone mass is lost during pregnancy, it is very difficult to restore, and you may be at increased risk for osteoporosis later in life. You should take a calcium supplement to prevent this."
C) "If you eat a diet that is rich in calcium, any bone mass that is lost during pregnancy and breastfeeding will be restored within several months of weaning the child."
D) "The baby won't require enough calcium during development to affect your bone mass or cause osteoporosis."
Answer: C
Explanation: A) Studies indicate that the more times women are pregnant, the greater the mother's bone density.
B) If the mother does not eat a diet rich in calcium, the baby draws what it needs from the mother's bones, causing a decrease in bone mass.
C) Any bone mass that is lost during pregnancy or breastfeeding is typically easily restored several months after the infant is weaned from the breast.
D) During pregnancy, the growing fetus requires calcium to develop the skeleton. Calcium is also required for milk production.
Page Ref: 902
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.6. Describe strategies to empower patients or families in all aspects of the health care process. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Implementation

Learning Outcome: 12.D. Analyze osteoporosis as it relates to metabolism. Differentiate care of patients with osteoporosis across the lifespan.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with osteoporosis.

Exemplar 12.E Thyroid Disease

1) The nurse suspects that a client is experiencing hypothyroidism. Which question should the nurse ask during the health history?
A) "Is your skin often clammy?"
B) "Do you have brown, shiny patches on your legs?"
C) "Are you intolerant to heat?"
D) "Have you had unexplained weight gain?"
Answer: D
Explanation: A) Cool, clammy skin is found in clients with low blood sugar.
B) Brown, shiny patches on the lower extremities are associated with poor circulation.
C) Heat intolerance is associated with hyperthyroidism.
D) The client experiencing hypothyroidism often gains weight even though they are eating less.
Page Ref: 906
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Identify the clinical manifestations of thyroid disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

2) The nurse is preparing an education session for nurses who work in an endocrinology clinic caring for older adult clients. Which statement about the thyroid should the nurse include in the teaching?
A) Thyroid hormone is often increased for older adult clients.
B) Symptoms of hypothyroidism in this group of clients are often confused with symptoms of aging.
C) Hypothyroidism is a congenital disease that manifests in older adult clients.
D) Hypothyroidism presents with pitting edema for this group of clients.
Answer: B
Explanation: A) Thyroid hormone is decreased in all clients with hypothyroidism.
B) The diagnosis is often missed for this group of clients as the clinical manifestations are confused with symptoms of aging.
C) Not all hypothyroidism is congenital, and it is inaccurate to state that older adult clients develop the disease due to congenital defects.
D) The older adult client will present with nonpitting edema.

Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Differentiate care of patients with thyroid disease across the lifespan.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

3) The nurse is caring for an adult client recently diagnosed with hypothyroidism. After reviewing the nursing admission assessment, on which documented findings should the nurse plan care for this client? **Select all that apply.**

A) Hypothermia
B) Hot flashes
C) Nausea
D) Constipation
E) Tachycardia

Answer: A, D

Explanation: A) Hypothyroidism is often accompanied by hypothermia.
B) Hot flashes do not occur in hypothyroidism.
C) Nausea is not a symptom of hypothyroidism.
D) Hypothyroidism is often accompanied by constipation.
E) Tachycardia is not a symptom of hypothyroidism.

Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Identify the clinical manifestations of thyroid disease.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

4) The nurse is providing care for a young adult client with exophthalmos. Which problem would be the most appropriate for this client?
A) Disturbed body image
B) Inability to cope
C) Potential for an injury
D) Inability to perform activity
Answer: A
Explanation: A) Exophthalmos is a clinical manifestation associated with hyperthyroidism and may be a problem for a young client. The nurse would plan to assess self-esteem and make appropriate referrals.
B) The client's ability to cope could be an issue, but it would probably stem from the disturbed body image.
C) Potential for an injury is not a problem related to this condition.
D) Inability to perform activities is not a problem related to this condition.

Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Apply the nursing process in providing culturally competent care to an individual with thyroid disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

5) An older adult client with new-onset atrial fibrillation is sweating excessively. After reviewing the client's recent laboratory results, the nurse concludes that which might be causing the client's symptoms?

A) A hemoglobin (Hgb) level of 11.0 g/dL

B) A thyroid-stimulating hormone (TSH) level of 0.25 mU/mL

C) A TSH level of 18 mU/mL

D) A Hgb level of 13.8 g/dL

Answer: C

Explanation: A) Hgb 11.0 g/dL is a normal hemoglobin level.

B) TSH 0.25 mU/mL is indicative of hypothyroidism.

C) New-onset atrial fibrillation and excessive sweating are potential symptoms of hyperthyroidism. A TSH level above 5.5 mU/mL is considered high.

D) Hgb 13.8 g/dL is a normal hemoglobin level.

Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with thyroid disease.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

6) A client with hyperthyroidism is scheduled for surgery in a few days. Which collaborative intervention would address cardiovascular symptoms that may prevent the client from undergoing the procedure?
A) Nothing, because there is little effect on the quality of life in older adults.
B) Administration of antithyroid medications with propranolol
C) The ingestion of radioactive iodine, I-131
D) A combination treatment with levothyroxine (Synthroid) and amiodarone (Cordarone)
Answer: B
Explanation: A) There are interventions that can be taken to improve the quality of life in older clients.
B) Cardiovascular symptoms can be decreased rapidly by adding a beta-blocker, such as propranolol, to initial treatment with antithyroid medications.
C) Radioactive iodine treatment takes several weeks to take effect, and it doesn't directly address cardiovascular symptoms.
D) Levothyroxine increases thyroid hormone levels, so it would not be helpful for this client.
Page Ref: 910
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with thyroid disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

7) The nurse is caring for a client with Graves disease. When observing the facial features of the client the nurse notices the client's eyeballs protruding. The nurse notes that the client is exhibiting which associated sign of the disease?

A) Conjunctivitis
B) Lacrimation
C) Periorbital edema
D) Exophthalmos

Answer: D

Explanation: A) Conjunctivitis is not associated with Graves disease.
B) Lacrimation is a sign of Graves disease, but it is not associated with protruding eyeballs.
C) Periorbital edema is a sign of hypothyroidism, not hyperthyroidism.
D) Exophthalmos is a condition associated with Graves disease, caused by hyperthyroidism.

Page Ref: 907
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Identify the clinical manifestations of thyroid disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

8) A client with Graves disease requests that the nurse explain the results of recent laboratory tests. Which results would the nurse anticipate discussing with the client?
A) An increase in TSH levels
B) An increase in thyroid antibodies
C) A decrease in serum T4
D) An increase in serum T3
E) A decrease in T3 uptake
Answer: D
Explanation: A) The TSH level is not increased in Graves disease.
B) Thyroid antibodies develop in Hashimoto thyroiditis.
C) In Graves disease, serum T4 level increases.
D) In Graves disease, serum T3 increases.
E) In Graves disease, T3 uptake test is increased.
Page Ref: 909
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with thyroid disease.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

9) Which physiological change causes edema in adults with hypothyroidism?
A) Excess reabsorption of water and sodium in the kidneys
B) Decreased plasma oncotic pressure in the capillaries
C) Water retention in mucoprotein deposits in the interstitial spaces
D) Increased capillary permeability in the extremities
Answer: C
Explanation: A) The redistribution of water may trigger increased reabsorption of water and sodium in the kidneys, but excess reabsorption is not the cause of the edema.
B) Decreased plasma oncotic pressure is a less common cause of edema and may be due to other etiologies.
C) The hypothyroid state in adults is sometimes called myxedema, which reflects the accumulation of nonpitting edema in connective tissues throughout the body. The edema is the result of water retention in mucoprotein deposits in the interstitial spaces.
D) Increased capillary permeability is a less common cause of edema and may be due to other etiologies.
Page Ref: 914
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Describe the pathophysiology of thyroid disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

10) Increasing circulating levels of thyroid hormone heighten the sympathetic nervous system's physiologic response to stimulation. Which effect does this have on the cardiac system?
A) Increases stroke volume
B) Decreases cardiac rate
C) Lengthens the QRS interval
D) Decreases blood pressure
Answer: A
Explanation: A) The sensitizing effect of abnormally elevated thyroid hormone levels increases the cardiac rate and stroke volume. As a result, cardiac output and peripheral blood flow increase.
B) The sensitizing effect of abnormally elevated thyroid hormone levels increases cardiac rate.
C) Increased cardiac rate would result in a shortened QRS interval.
D) Stimulation of the sympathetic nervous system increases blood pressure.
Page Ref: 906
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Describe the pathophysiology of thyroid disease.
MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

11) Which client is at the greatest risk for developing hypothyroidism?

A) A 21-year-old woman who has a mother with Graves disease

B) A 32-year-old man who has an uncle with type 1 diabetes mellitus

C) A 57-year-old woman whose aunt had systemic lupus erythematosus

D) A 72-year-old man whose father had cardiovascular disease

Answer: C

Explanation: A) Risk factors for hypothyroidism include being female between the ages of 30 and 60.

B) Men are at a lower risk for hypothyroidism.

C) Risk factors for hypothyroidism include being female between the ages of 30 and 60 and having a close relative with an autoimmune condition.

D) Men are at a lower risk for hypothyroidism.

Page Ref: 913

Cognitive Level: Understanding

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Compare the risk factors and prevention of thyroid disease.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

12) The nurse is caring for a newborn born to a mother with uncontrolled hyperthyroidism during pregnancy. For which complication should the nurse monitor the newborn?

A) Late closure of fontanels
B) Slow heart rate
C) Rapid weight gain
D) Breathing problems

Answer: D

Explanation: A) Hyperthyroidism in a newborn can result in early closure of fontanels.
B) Hyperthyroidism in a newborn can result in a rapid heart rate.
C) Hyperthyroidism in a newborn can result in poor weight gain.
D) Hyperthyroidism in a newborn can result in breathing issues due to an enlarged thyroid gland that presses against the trachea.

Page Ref: 911

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment

Learning Outcome: 12.E. Analyze thyroid disease as it relates to metabolism. Differentiate care of patients with thyroid disease across the lifespan.

MNL LO: Demonstrate understanding of the concept of metabolism in the care of a patient with thyroid disease.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e **(Pearson)**
Module 13 Mobility

The Concept of Mobility

1) An adult client is diagnosed with a degenerative bone disease that is impairing mobility. Based on this information alone, which action should the nurse complete first?
A) Implement a low-level exercise program for the client
B) Assess the client's pain management
C) Teach the client relaxation techniques
D) Refer the client to a dietitian
Answer: B
Explanation: A) When caring for a client with a degenerative bone disease that is impairing mobility, the nurse should assess pain management prior to implementing an exercise program.
B) When caring for a client with a degenerative bone disease that is impairing mobility, the nurse should assess pain management first.
C) When caring for a client with a degenerative bone disease that is impairing mobility, the nurse should assess pain management prior to teaching relaxation exercises.
D) When caring for a client with a degenerative bone disease that is impairing mobility, the nurse should assess pain management prior to referring to a dietitian.
Page Ref: 933
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.6. Analyze independent interventions nurses can implement for patients with alterations in mobility.
MNL LO: Analyze the concept of mobility and its application to nursing care.

2) A preadolescent client who fell from a balance beam in physical education class injures an ankle. Which action should the nurse take?
A) Refer the client to physical therapy
B) Place an ice pack on the client's ankle
C) Plan for a corticosteroid injection
D) Order an x-ray of the ankle
Answer: B
Explanation: A) If physical therapy is needed, the referral would be given after the ankle has had time to heal.
B) An appropriate intervention for a client who experiences an ankle injury is placing ice on the ankle to limit swelling.
C) A corticosteroid injection would be more appropriate for a client with osteoarthritis, not an acute ankle injury.
D) Ordering an x-ray of the ankle is outside the nurse's scope of practice.
Page Ref: 929
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.6. Analyze independent interventions nurses can implement for patients with alterations in mobility.
MNL LO: Analyze the concept of mobility and its application to nursing care.

3) The nurse is conducting a gait and posture assessment for a client who is experiencing mobility issues. Which action by the nurse is appropriate during this assessment?
A) Assessing the client's muscle mass and strength
B) Measuring the length and circumference of the client's extremities
C) Inspecting the client's spine for curvature
D) Palpating the client for tenderness and pain
Answer: C
Explanation: A) Assessing muscle mass and strength is a part of the physical assessment for clients who are experiencing mobility issues.
B) Measuring the length and circumference of the extremities is completed for clients who are experiencing mobility issues.
C) When assessing a client's gait and posture, the nurse should be sure to inspect the client's spine for curvature.
D) Palpating for tenderness and pain are part of the physical assessment for clients who are experiencing mobility issues.
Page Ref: 935
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.5. Differentiate among common assessment procedures and tests used to examine mobility.

MNL LO: Analyze the concept of mobility and its application to nursing care.

4) The nurse is caring for a client who is experiencing limited mobility related to a musculoskeletal alteration. Which laboratory tests would be useful to diagnose the client? **Select all that apply.**
A) Magnetic resonance imaging (MRI)
B) Alkaline phosphatase (ALP)
C) Human leukocyte antigen-B27 (HLA-B27)
D) Rheumatoid factor (RF)
E) Electromyography (EMG)
Answer: B, C, D
Explanation: A) MRI is a diagnostic test used to diagnose the cause of alterations in mobility.
B) ALP is produced by bone and other organs. Increased ALP may indicate bone disease, bone fracture, bone tumors, osteomalacia, Paget disease, or rickets. Decreased ALP may indicate Wilson disease.
C) The presence of HLA-B27 indicates an increased risk for ankylosing spondylitis and arthritis.
D) Elevated levels of RF may indicate rheumatoid arthritis, scleroderma, lupus erythematosus, and adult Still disease.
E) EMG is a diagnostic test used to diagnose the cause of alterations in mobility.
Page Ref: 941
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 13.5. Differentiate among common assessment procedures and tests used to examine mobility.
MNL LO: Analyze the concept of mobility and its application to nursing care.

5) A client who is 28 weeks pregnant asks what can be done for lower back pain. Which response should the nurse make?

A) "Back pain is common during pregnancy and can usually be managed by taking nonsteroidal anti-inflammatory drugs (NSAIDs)."

B) "Let's talk about some postural adjustments that might help alleviate your pain."

C) "Back pain during pregnancy is often related to kidney infection. Have you experienced any recent urinary problems, including pain when voiding?"

D) "The physician will likely order an x-ray to investigate potential causes of your pain."

Answer: B

Explanation: A) The recommended pain medication is acetaminophen, because NSAIDs are contraindicated during pregnancy.

B) Back pain is common during pregnancy due to strain on the back from the growing uterus and fetus; abdominal weakness from stretched abdominal muscles; and hormonal changes that loosen the ligaments in the joints of the pelvis. Pregnancy-related back pain is usually managed conservatively. Postural changes or other adaptations can help increase mobility and decrease discomfort.

C) Kidney infection is not a leading cause of back pain in pregnant women.

D) Although diagnostic imaging may be useful, x-rays should be avoided because they deliver ionizing radiation to the fetus.

Page Ref: 946

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

WwW.TeSt.Ws

Learning Outcome: 13.8. Differentiate considerations related to the care of patients with alterations in mobility throughout the lifespan.

MNL LO: Analyze the concept of mobility and its application to nursing care.

6) The nurse is caring for a preadolescent male client who is accompanied by a parent. Which statement by the parent would be consistent with the client experiencing growing pains?
A) "My child often complains about sore arms and legs.”
B) "My child seems to get injured very easily, especially broken bones."
C) "My child often doesn't want to walk because of knee pain."
D) "My child occasionally complains of lower back pain."
Answer: A
Explanation: A) Long bones of children contain an epiphyseal plate that serves as a location for bone growth. Rapid bone growth in these long bones may produce growing pains as the lengthening bones pull on the muscles. Because this only occurs in the long bones, growing pains are most likely to be felt in the arms and legs.
B) Growing pains are not associated specifically with fractured bones.
C) Growing pains would not cause joint pain.
D) Growing pains would not cause lower back pain.
Page Ref: 945
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 13.8. Differentiate considerations related to the care of patients with alterations in mobility throughout the lifespan.
MNL LO: Analyze the concept of mobility and its application to nursing care.

7) The nurse is planning care for a client who is experiencing an alteration in mobility. Which would the nurse include as an independent nursing intervention?
A) Instructing on the importance of proper nutrition and an active lifestyle
B) Administering a prescribed nonsteroidal anti-inflammatory drug (NSAID)
C) Identifying necessary modifications to the home environment
D) Prescribing a skeletal muscle relaxant
Answer: A
Explanation: A) An appropriate independent nursing intervention for a client who is experiencing an alteration in mobility is providing instruction on the importance of proper nutrition and an active lifestyle.
B) Administering a prescribed NSAID is an example of a collaborative intervention that the nurse can implement.
C) Identifying necessary modifications for the home environment is a collaborative intervention often implemented by the occupational therapist.
D) Although it is appropriate for the nurse to administer a skeletal muscle relaxant, it is outside the scope of nursing practice to prescribe this medication.
Page Ref: 942

Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

WwW.TeSM.Us

Learning Outcome: 13.6. Analyze independent interventions nurses can implement for patients with alterations in mobility.
MNL LO: Analyze the concept of mobility and its application to nursing care.

8) The nurse is providing care for a client who is experiencing subjective symptoms of carpal tunnel syndrome. Which test should the nurse anticipate being performed by a provider during the physical assessment of this client?
A) Bulge test
B) Ballottement test
C) Phalen test
D) McMurray test
Answer: C
Explanation: A) The Bulge test is used to assess the knee.
B) The ballottement test is used to assess the knee.
C) Phalen test is a special assessment to determine whether the client is experiencing carpal tunnel syndrome. With this test, the wrists are held in acute flexion for 60 seconds. Numbness, tingling, or pain may indicate carpal tunnel syndrome.
D) The McMurray test is used to assess the knee.
Page Ref: 939
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.5. Differentiate among common assessment procedures and tests used to examine mobility.
MNL LO: Analyze the concept of mobility and its application to nursing care.

WW.TBSM.WS

9) The nurse is caring for an adult client who sustained a right distal radial fracture and a left tibia fracture. Which mobility aid does the nurse anticipate being used for this client?
A) Lofstrand crutches
B) Platform crutches
C) Walker
D) Axillary crutches
Answer: B
Explanation: A) Lofstrand crutches require use of the wrists.
B) This client has fractures in both the leg and wrist. Platform crutches are used for clients who are unable to bear weight on their wrists.
C) A walker requires the use of the wrists.
D) Axillary crutches require the use of the wrists.
Page Ref: 944
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.7. Summarize collaborative therapies used by interprofessional teams for patients with alterations in mobility.
MNL LO: Analyze the concept of mobility and its application to nursing care.

10) Which cells should the nurse identify that produce the matrix for bone formation?
A) Osteoclasts
B) Sarcomeres
C) Osteoblasts
D) Epiphyseal plates
Answer: C
Explanation: A) Osteoclasts are cells that break down bone tissue.
B) Sarcomeres are filaments made of actin or myosin that are found within muscle.
C) Osteoblasts are the cells that produce the matrix for bone formation.
D) Epiphyseal plates are areas of cartilage located between the epiphysis and diaphysis of a child's long bones.
Page Ref: 945
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.1. Analyze the physiology of mobility in the body.
MNL LO: Analyze the concept of mobility and its application to nursing care.

11) Which score would a nurse select from the muscle function grading scale if the client has full strength and range of motion in a given joint?

A) 0
B) 5
C) 8
D) 10
Answer: B
Explanation: A) A score of 0 indicates paralysis, meaning that the client cannot contract the muscles associated with a given joint.
B) A score of 5 indicates that the client can move a joint through the full range of motion under full resistance.
C) The muscle function grading scale ranges from 0 to 5.
D) The muscle function grading scale ranges from 0 to 5.
Page Ref: 934
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 13.5. Differentiate among common assessment procedures and tests used to examine mobility.
MNL LO: Analyze the concept of mobility and its application to nursing care.

12) Within the human body, which type of connective tissue connects bones to other bones to form a joint?
A) Tendon
B) Ligament
C) Cartilage
D) Myelin
Answer: B
Explanation: A) Tendons connect bones to muscles and carry the contractile forces from the muscle to the bone to cause movement.
B) Ligaments connect bones to other bones to form a joint.
C) Cartilage is a type of flexible connective tissue found in many locations throughout the body.
D) Myelin is not a type of connective tissue but rather a fatty substance that insulates neuronal axons and promotes faster signal transmission.
Page Ref: 926
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 13.1. Analyze the physiology of mobility in the body.
MNL LO: Analyze the concept of mobility and its application to nursing care.

13) A client presents with an alteration in mobility. Which finding would suggest damage to the muscle?
A) Increased PTH levels
B) Decreased PTH levels
C) Decreased CK levels
D) Increased CK levels
Answer: D
Explanation: A) Parathyroid hormone (PTH) levels are not linked to muscle inflammation but rather to osteoporosis, kidney disease, parathyroid gland tumors, lack of calcium, and vitamin D disorders.
B) Parathyroid hormone (PTH) levels are not linked to muscle inflammation but rather to osteoporosis, kidney disease, parathyroid gland tumors, lack of calcium, and vitamin D disorders.
C) Creatine kinase (CK) is used to detect muscle damage, muscle inflammation, rhabdomyolysis, polymyositis, and muscular dystrophy. Increased CK levels are suggestive of increased muscle inflammation.
D) Creatine kinase (CK) is used to detect muscle damage, muscle inflammation, rhabdomyolysis, polymyositis, and muscular dystrophy. Increased CK levels are suggestive of increased muscle inflammation.

Learning Outcome: 13.5. Differentiate among common assessment procedures and tests used to examine mobility.
MNL LO: Analyze the concept of mobility and its application to nursing care.

Exemplar 13.A Back Problems

1) The nurse is providing care to a client who is experiencing back pain. Which item in the client's history is a known risk factor for disc herniation?
A) 49 years of age
B) Female gender
C) Short stature
D) Anorexia
Answer: A
Explanation: A) The client's age is a known risk factor; herniated discs are most common between the ages of 30 and 50, because discs naturally degenerate with age.
B) Male gender is a risk factor for back pain.
C) Other risk factors include tall height.
D) Other risk factors include excess weight (which is extremely uncommon in clients with anorexia).
Page Ref: 949
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Compare the risk factors for and prevention of back problems.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

2) Which client is at increased risk for back problems? **Select all that apply.**

A) A 45-year-old man who has played golf three times a week for the past 20 years

B) An 18-year-old woman who has been a distance runner since middle school

C) A 62-year-old man who is a heavy truck mechanic and has a body mass index (BMI) of 30

D) A 12-year-old boy who has a history of cerebral palsy and a current BMI of 21

E) A 78-year-old man with a 40 pack-year smoking history who was recently widowed

Answer: C, D, E

Explanation: A) Playing golf does not cause a high risk of back problems.

B) Running track does not increase the risk of back problems.

C) Factors that increase the risk of herniated intervertebral discs include male gender, age (clients over 30 are at higher risk), obesity, history of smoking, and regularly engaging in heavy lifting. The 62-year-old client has multiple traits that puts him at elevated risk of disc herniation.

D) Risk factors for scoliosis include age of between 9 and 15 and history of cerebral palsy; thus, the 12-year-old client is at elevated risk for this condition.

E) Factors that increase the risk of herniated intervertebral discs include male gender, age (clients over 30 are at higher risk), obesity, history of smoking, and regularly engaging in heavy lifting. The 78-year-old client has multiple traits that puts him at elevated risk of disc herniation.

Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Compare the risk factors for and prevention of back problems.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

3) A preadolescent client is recovering from spinal fusion surgery for scoliosis. Which nursing interventions should the nurse implement to address comfort and mobility? **Select all that apply.**
A) Reposition every 2 hours.
B) Monitor intake and output.
C) Encourage and assist with range of motion (ROM) exercises every 4 hours while awake.
D) Administer pain medication around the clock.
E) Encourage incentive spirometer use every 4 hours while awake.
Answer: A, C, D
Explanation: A) Interventions that address movement restrictions and/or pain in a preadolescent client recovering from spinal fusion include repositioning every 2 hours.
B) Monitoring intake and output would be applicable for the problem of fluid imbalance.
C) Interventions that address movement restrictions and/or pain in a preadolescent client recovering from spinal fusion include encouraging and assisting with ROM exercises every 4 hours while awake.
D) Interventions that address movement restrictions and/or pain in a preadolescent client recovering from spinal fusion include administering pain medication around the clock.
E) The use of an incentive spirometer may be appropriate after surgery, but it would relate to a problem with oxygenation.

Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with back problems.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

4) A client recovering from surgery for a herniated disc has a HR 100, RR 22, BP 130/86 mmHg, T 98.8°F, and pain rating of 7 on a scale of 0 to 10. Which problem is the highest priority for this client?
A) Compromised physical mobility
B) Acute pain
C) Risk for injury
D) Chronic pain
Answer: B
Explanation: A) Compromised physical mobility would be the result of the surgery.
B) The client is currently experiencing acute pain as evidenced by elevated vital signs and a pain rating of 7 on a 0-to-10 scale.
C) There is no evidence that the client is at risk for injury.
D) The client was likely experiencing chronic pain prior to the surgery, and it probably contributed to the need for the procedure.
Page Ref: 952
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with back problems.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

5) The nurse is planning care for a client with acute back pain who is a single mother of two small children and works part-time as a receptionist. Based on this information, which nursing intervention is the highest priority?
A) Instructing the client in appropriate body mechanics for lifting and ways to modify her work environment
B) Suggesting that the client take time off from work until her back is healed
C) Obtaining an order for nonsteroidal anti-inflammatory drugs (NSAIDs) from the client's healthcare provider
D) Suggesting that the client's children be taken care of by an extended family member until the client's back is healed
Answer: A
Explanation: A) The client is at risk for injury given that she has two small children who need care and a part-time job that is sedentary. To help the client better manage health, the nurse should provide instruction on appropriate body mechanics for lifting and ways to modify the work environment.
B) Suggesting that the client take time off from work may or may not be appropriate and should not be included in the plan of care.
C) The client may or may not be prescribed NSAIDs.
D) Having extended family members care for the children may or may not be appropriate and should not be included in the plan of care.

Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with back problems.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

6) The nurse is planning care for a client who is 1 day postoperative after spinal fusion surgery. Which outcome should the nurse identify for this client?
A) The client will remain in prone position.
B) The client will maintain urine output at 20 mL per hour.
C) The client will use the incentive spirometer every 2 hours.
D) The client will void 12 hours after surgery.
Answer: C
Explanation: A) The client is not expected to remain in a prone position.
B) Urine output should be at least 30 mL per hour.
C) An appropriate outcome for this client is the use of an incentive spirometer every 2 hours.
D) The client should void within 8 hours of surgery.
Page Ref: 954

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with back problems.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

7) The nurse is documenting the interprofessional team report on an adolescent client who has a 35-degree Cobb angle confirmed by x-ray. Which interventions should the nurse anticipate being included in the collaborative plan of care for this client? **Select all that apply.**
A) Obtaining a physical therapy consult prior to surgical intervention
B) Maintaining the existing curvature with no increase
C) Bracing for 12-23 hours per day and providing a support group referral
D) Administering nonopioid analgesics and a TLSO or Milwaukee brace
E) Instructing the client on exercises and appropriate support groups
Answer: C, D, E
Explanation: A) Severe scoliosis requires surgical intervention and subsequent physical therapy.
B) Mild scoliosis requires observation every 3-6 months.
C) Treatment of children with a Cobb angle between 25 and 45 degrees consists of bracing for 12-23 hours per day and a support group referral.
D) Treatment of children with a Cobb angle between 25 and 45 degrees consists of bracing with a TLSO or Milwaukee brace and mild pain medication.
E) Treatment of children with a Cobb angle between 25 and 45 degrees consists of counseling or support group referral, and exercise to improve posture and maintain or increase spine flexibility.
Page Ref: 955
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with back problems.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

8) Which region of the spine is the most common location of herniated discs?
A) C1-C2
B) T7-T8
C) L4-L5
D) S1-S2
Answer: C
Explanation: A) The most common location of herniated discs is not between cervical 1 and 2.
B) The most common location of herniated discs is not between thoracic 7 and 8.
C) The most common location of herniated discs is the lumbar region (L4-L5).
D) The most common location of herniated discs is not sacral 1 and 2.
Page Ref: 949
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Identify the clinical manifestations of back problems.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

9) On the first postoperative day after spinal fusion, the nurse assesses a client and notes the following vital signs: T 39.2°C, BP 100/50 mmHg, HR 118, and RR 23. Drainage at the client's incision site is clear and tests positive for glucose. Which assessment parameter indicates the highest risk for surgical wound infection?
A) Temperature
B) Incisional drainage positive for glucose
C) Heart rate 118 bpm
D) Presence of incisional drainage
Answer: B
Explanation: A) Temperature above 38°C is a fever. Fever may be a sign of infection anywhere in the body, not just at the surgical wound site.
B) The presence of glucose in the drainage is indicative of cerebrospinal fluid (CSF). A CSF leak increases the risk of infection of the surgical site and meninges.
C) The client's heart rate could be elevated for numerous reasons.
D) Incisional drainage isn't necessarily problematic.
Page Ref: 954
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with back problems.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

10) The mother of a preadolescent client meets with the school nurse to discuss the client's recent diagnosis of scoliosis. Which interventions would be appropriate for the problem of disturbed body image related to deformity and brace? **Select all that apply.**
A) Including the student and family in a meeting to elicit her feelings about scoliosis and wearing a brace
B) Offering to arrange a meeting for the student with an 8th grader who has scoliosis
C) Encouraging the student and family to register for home schooling to minimize the risk of ridicule
D) Teaching the student and family about clothing that will hide the brace
E) Suggesting that the pediatrician prescribe an anti-anxiety agent for the student
Answer: A, B, D
Explanation: A) Interventions for the problem of a disturbed body image include asking the student to explain feelings about scoliosis and wearing a brace.
B) For disturbed body image, offering a support group or person with the condition is appropriate.
C) Avoiding other children and community encounters will increase the client's risk of social isolation.
D) Teaching the student and family about clothes that will hide the brace is appropriate.
E) There is not enough information to indicate a problem that requires pharmacologic management.
Page Ref: 958
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Differentiate considerations for care of patients with back problems across the lifespan.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

11) During a home care visit, an older adult client begins to cry softly when asked about coping with back pain. The client states, "My back hurts bad all the time. I am so confused about all these tests and scared that the doctor wants me to have surgery." Which action should the nurse take?

A) Asking the client to rate the pain on a scale of 0 to 10
B) Explaining potential procedures in a way the client will understand
C) Administering all pain medication as ordered
D) Attentively listening to the client's thoughts and fears

Answer: D

Explanation: A) A pain assessment has most likely already been completed.
B) Explaining potential procedures will be done after the assessment is complete and the plan of care is set in place.
C) The client is at home and is most likely self-administering medications.
D) The priority nursing intervention for a client who is ready to disclose emotions is to attentively listen to the client's thoughts and fears.

Page Ref: 954

Cognitive Level: Analyzing

Client Need/Sub: Psychosocial Integrity

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with back problems.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

12) An adolescent client with scoliosis has a Cobb angle of 32 degrees. For which treatment should the nurse anticipate preparing for this client?
A) No specific treatment.
B) Physical therapy.
C) Wearing a brace.
D) Spinal fusion surgery.
Answer: C
Explanation: A) Typically, clients with Cobb angles less than 15 degrees do not require treatment.
B) Clients with Cobb angles of 15 to 25 degrees are treated conservatively with physical therapy.
C) Clients with Cobb angles between 25 and 40 degrees are advised to wear a corrective brace.
D) For clients with Cobb angles in excess of 40 degrees, spinal fusion surgery is the most effective option.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

WW.TBSM.WS

13) Which condition or symptom is most common in clients with a herniated cervical disc?
A) Sciatica
B) Stiff neck and shoulder pain
C) Changes in knee and ankle reflexes
D) Cauda equina syndrome
Answer: B
Explanation: A) Sciatica is associated with lumbar disc herniation.
B) Herniation of the cervical discs is more commonly associated with numbness, tingling, muscle spasms, and weakness in the upper body, as well as stiff neck and shoulder pain that radiates to the arms and fingers.
C) Changes in knee and ankle reflexes is associated with lumbar disc herniation.
D) Cauda equina syndrome is associated with lumbar disc herniation.

Learning Outcome: 13.A. Analyze back problems as they relate to mobility. Identify the clinical manifestations of back problems.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with back problems.

Exemplar 13.B Fractures

1) A client sustained multiple fractures in a motor vehicle crash. Of the various fracture types sustained by the client, which type places the client at highest risk for osteomyelitis?
A) Avulsion
B) Open
C) Comminuted
D) Depression
Answer: B
Explanation: A) An avulsion fracture is closed from the environment and presents a lower risk of infection.
B) The risk for osteomyelitis, or bone infection, is highest with an open fracture, in which the bone breaks through the skin.
C) A comminuted fracture is closed from the environment and presents a lower risk of infection.
D) A depression fracture is closed from the environment and presents a lower risk of infection.
Page Ref: 961
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Describe the pathophysiology of fractures.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

2) The nurse is caring for clients in an assisted living facility. Which resident would the nurse identify as being at the highest risk for the development of fractures from a fall?
A) A resident who participates in resistance training exercises three times a week and takes a calcium supplement
B) A resident who hikes in the woods once a week and smokes 14 cigarettes per day
C) A resident who line dances twice per week and has a glass of wine with dinner
D) A resident who teaches yoga four times per week and is lactose intolerant
Answer: B
Explanation: A) Resistance training and taking a calcium supplement decreases the risk of fracture with a fall.
B) Among older adult clients, smoking is the highest-risk behavior. Although exercise helps prevent fractures, hiking on an uneven surface can be a risk.
C) Line dancing decreases the risk of fracture with a fall. Consuming one glass of wine each day is not a risk factor for fractures from a fall.
D) Yoga decreases the risk of fracture with a fall. Lactose intolerance can lower calcium intake, although there are other sources of dietary or supplemental calcium that lactose-intolerant clients can use to reduce their fracture risk.
Page Ref: 962-963
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Compare the risk factors for and prevention of fractures.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

3) The nurse is teaching an older adult client and caregiver about appropriate ways to decrease the client's risk for falls. Which interventions are appropriate for the nurse to include in this teaching session? **Select all that apply.**
A) Start walking for exercise several times per week.
B) Wear sensible shoes with good support when shopping.
C) Wear socks when walking in the kitchen.
D) Encourage the use of throw rugs throughout the home.
E) Make sure hallways and stairways have adequate lighting, even at night.
Answer: A, B, E
Explanation: A) A mild to moderate exercise program is beneficial, as it helps improve balance and strength, thus reducing the likelihood of falls.
B) Interventions that are appropriate to decrease this client's risk for falls include wearing sensible shoes with good support when shopping.
C) Nonslip footwear should be encouraged.
D) Throw rugs should be discouraged.
E) Interventions that are appropriate to decrease this client's risk for falls include making sure hallways and stairways have adequate lighting, even at night.

Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Compare the risk factors for and prevention of fractures.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

4) The nurse is teaching a parent warning signs and symptoms to watch for in a child who will be discharged with a full leg cast. Which statements by the parent indicate the need for further instruction? **Select all that apply.**
A) "If the foot turns white and cold, I should call the physical therapist."
B) "I can expect that my child will have some pain, but the medicine should help."
C) "We can use a blow dryer on warm to help with the itching that my child will experience."
D) "We can cut a hole in the cast if my child's foot swells until we get to the doctor's office."
E) "It is okay if the plaster cast gets damp as long as I blow dry it."
Answer: A, C, D, E
Explanation: A) If the child's foot turns white and cold, the family should contact the physician.
B) The option that indicates appropriate understanding of cast care is the mother's statement that her child may have pain that will be relieved by medication.
C) Itching may be helped by use of a blow dryer on the cool setting.
D) Holes should not be cut in the cast.
E) The plaster should stay dry at all times.
Page Ref: 966
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

5) A client in an inpatient rehabilitation unit is currently in halo traction. Based on this information, which problem should be the priority for the client?
A) Potential for peripheral neurovascular dysfunction
B) Risk for infection
C) Potential for disuse syndrome
D) Acute pain
Answer: B
Explanation: A) Halo traction is not connected to weights, so the problem for peripheral neurovascular dysfunction is not applicable.
B) Halo traction uses pins that are surgically implanted in the skull, which increases the risk for infection.
C) Risk for disuse syndrome is another appropriate but lower-priority problem.
D) Acute pain is not as high a priority as the risk for infection.
Page Ref: 968
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with a fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

6) The x-ray of a client 14 weeks post-ulnar fracture exhibits no callus formation. Based on this data, which collaborative intervention should the nurse anticipate?
A) The physical therapist will set up Buck traction.
B) The surgeon will schedule a consultation with the client.
C) The pharmacist will educate the client on antibiotics.
D) The nurse will counsel the client on starting range-of-motion exercise.
Answer: B
Explanation: A) Buck traction is not indicated for nonunion of a fracture.
B) An ulnar fracture that does not show callus formation after 14 weeks would be classified as experiencing nonunion. Nonunions frequently require surgical correction.
C) Antibiotics are not indicated for nonunion of a fracture.
D) Exercise is not indicated for nonunion of a fracture.
Page Ref: 960
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

7) The nurse is caring for a client with a fracture requiring a plaster cast. Which nursing intervention is appropriate for this client?
A) Prescribing opioid pain medication
B) Assessing the client's neurovascular status
C) Discouraging client ambulation
D) Encouraging the client to keep the cast damp
Answer: B
Explanation: A) The nurse can administer an opioid pain medication but cannot prescribe one.
B) It is appropriate for the nurse to assess the client's neurovascular status to monitor for compartment syndrome related to the fracture.
C) The nurse should encourage the client to ambulate.
D) The nurse should encourage the client to keep the plaster cast dry.
Page Ref: 966
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with a fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

8) The nurse in an orthopedic outpatient clinic expects to see several clients with fractures for follow-up. Which client is at highest risk for a delayed union?
A) A 20-year-old college student with type I diabetes mellitus who sustained a fractured tibia in a bicycle accident. The nutrition recall tool completed during the client's last visit was consistent with American Diabetic Association (ADA) guidelines.
B) A 62-year-old bartender with a history of peptic ulcer disease who sustained a fractured clavicle breaking up a fight at work. During his prior visit, the client stated he was upset that his injury required him to abstain from upper body resistance training.
C) A 49-year-old teacher with osteoporosis who sustained an open ulnar fracture in a motor vehicle crash. At her last visit, the client reported that she had cut down smoking to 10 cigarettes per day.
D) A 55-year-old accountant who sustained fractures to the 4th and 5th right metatarsals. The client has a history of hypertension that is well controlled with medication.
Answer: C
Explanation: A) Although diabetes does increase the risk of delayed union, this client is young and exercised on a bicycle prior to the crash. If the client is following an ADA diet, there is adequate intake of vitamin D and calcium, which fosters bone healing.
B) Peptic ulcer disease is not a risk factor for delayed bone healing.
C) Evaluating the risk of delayed union requires knowledge of the factors that impact bone healing. The client at greatest risk of delayed union has two factors that decrease the likelihood of proper healing: an open fracture and osteoporosis. This client also uses tobacco, which decreases blood supply to the healing bone.
D) Hypertension is not a risk factor for delayed bone healing.
Page Ref: 960, 963

Cognitive Level: Evaluating
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Compare the risk factors for and prevention of fractures.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

9) A client with an open reduction and internal fixation of a fractured femur reports right calf pain. The nurse notes that the client's right calf is 3.5 cm larger than the left calf with generalized posterior erythema. The right calf is tender to touch, and the dorsalis pedis pulse is 3/4+ bilaterally. Which action should the nurse make a priority?
A) Use a Doppler stethoscope to confirm pedal pulses.
B) Notify the healthcare provider of the findings.
C) Prepare to apply a cast to the right leg.
D) Prepare to administer intravenous heparin.
Answer: B
Explanation: A) If a pedal pulse can be palpated, then a Doppler stethoscope is not needed.
B) These findings indicate possible deep vein thrombosis (DVT). The nurse's first action upon assessing these signs and symptoms should be to notify the healthcare provider immediately.
C) A cast is not indicated with internal fixation.
D) Intravenous heparin will likely be ordered after the condition is confirmed by the provider.
Page Ref: 964
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with a fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

10) A client who is hospitalized after a left hip fracture is scheduled for surgery late this afternoon. After receiving report, the nurse evaluates the Buck traction applied by a new physical therapist. Which finding would indicate that the traction is correctly applied?
A) A foam boot covers the right lower leg from the knee down.
B) Twenty-pound weights are connected to the bottom of a foam boot.
C) Weights are supported by a stool at the end of the bed.
D) The left knee and hip are in alignment above a foam boot.
Answer: D
Explanation: A) A foam boot covers the affected leg–in this case, the left leg, not the right.
B) Because Buck traction is a type of skin traction, it does not involve heavy weights; usually, 5-pound weights are used.
C) The weights always hang free from a pulley and are never supported by a stool at the end of the bed.
D) The correct placement of Buck traction permits the client's left knee and hip to align.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

11) During which phase of the fracture healing process is woven bone replaced by lamellar bone?
A) Reactive
B) Reparative
C) Remodeling
D) Inflammatory
Answer: C
Explanation: A) In the reactive or inflammatory phase of fracture healing, a hematoma forms around the injury. Inflammatory cells then enter the wound and degrade debris and bacteria in the area.
B) In the reparative phase, fibroblasts, osteoblasts, and chondroblasts begin to secrete collagen to form fibrocartilage, which develops into a soft callus that joins the fractured bone. Once the soft callus is formed, it is replaced by woven bone through endochondral ossification, which forms a hard callus.
C) During the remodeling phase, woven bone is replaced by highly organized lamellar bone.
D) In the reactive or inflammatory phase of fracture healing, a hematoma forms around the injury. Inflammatory cells then enter the wound and degrade debris and bacteria in the area.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Describe the etiology of fractures.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

12) Which fracture presents the greatest risk for development of fat embolism syndrome?
A) Open fracture of the fibula
B) Closed fracture of the femur
C) Open fracture of the humerus
D) Closed fracture of the clavicle
Answer: B
Explanation: A) Fat embolism does not usually occur with a fractured fibula.
B) Fat embolism syndrome may occur in conjunction with closed fractures of the long bones or pelvis. The fracture of the femur is the injury that presents the greatest risk for development of fat embolism syndrome.
C) Fat embolism does not usually occur with a fractured humerus.
D) Fat embolism does not usually occur with a fractured clavicle.
Page Ref: 964
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.B. Analyze fractures as they relate to mobility. Identify the clinical manifestations of fractures.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with fractures.

Exemplar 13.C Hip Fractures

1) The nurse is presenting a program at a senior center on how to survive a fall. Which statement by a program participant indicates that this person needs clarification about what emergency actions to take after a fall?
A) "I should crawl to a phone on the affected side to keep it stable against a hard surface."
B) "I should try to cover myself with a blanket while I wait for help to arrive."
C) "To call for help, I can scoot on my bottom to a low wall-mounted phone."
D) "If possible, I can crawl to a stairway and use the stairs to lift up to a standing position."
Answer: A
Explanation: A) These clients should be instructed to turn onto the stomach and crawl to the phone.
B) While waiting for help to arrive, clients should cover themselves with a blanket if possible, to help prevent shock.
C) These clients should be instructed to scoot to the phone using the buttocks on the uninjured side.
D) One option is to crawl to a stairway and use the stairs to gradually lift the body to a standing position.
Page Ref: 973

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation

WW.TBSM.WS

Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Compare the risk factors for and prevention of hip fractures.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

2) The nurse is assessing an older adult client in a long-term care facility after a fall. Which finding requires priority action?

A) The injured leg is shortened and externally rotated.
B) Redness and severe swelling are found at the hip joint.
C) Pain is relieved by moving the affected extremity.
D) The client is repeatedly flexing the injured leg at the hip.

Answer: A

Explanation: A) The client with a fractured hip is often in extreme pain and assumes a position with the leg on the affected side shortened and externally rotated because of gravity and the pull of the muscles.

B) Redness and swelling are the classic signs of inflammation not immediately present after hip fracture.

C) Any movement of the leg on the side of the affected hip is likely to cause severe muscle spasms and further pain. Pain being relieved by movement would not be a priority.

D) Extreme pain associated with hip fracture prevents any voluntary movement in the leg. Being able to flex the injured leg at the hip would not be a priority.

Page Ref: 974

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Identify the clinical manifestations of hip fractures.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

3) A postmenopausal client asks the nurse what she can do to prevent fracturing her hips, as her mother and grandmother both experienced this health problem. Which response by the nurse is most appropriate?
A) "You should avoid all types of exercise."
B) "You should consider a smoking cessation program."
C) "You should limit your exposure to the sun."
D) "You should use throw rugs throughout your home."
Answer: B
Explanation: A) The client should not be instructed to avoid exercise; exercise will enhance the client's gait, balance, and musculoskeletal strength.
B) One modifiable risk factor for hip fractures is smoking. Women who smoke have a greater risk of fracture because smoking reduces bone density in menopausal and postmenopausal women.
C) Limiting sun exposure will not impact the client's risk of experiencing a hip fracture.
D) The nurse should not instruct the client to use throw rugs throughout the home because this could cause tripping, leading to a fall.
Page Ref: 973
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Compare the risk factors for and prevention of hip fractures.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

4) The first day after surgery to repair a fractured hip sustained from a fall, an older adult client refuses to ambulate but states, "I will consider it tomorrow." Which action should the nurse take?
A) Coordinate personnel to assist with ambulation
B) Document the client's refusal
C) Assess why the client is refusing to ambulate
D) Notify the healthcare provider
Answer: C
Explanation: A) The nurse should not force the client to get out of bed.
B) Documenting the client's refusal is appropriate, but after determining the reason for the refusal.
C) The first thing the nurse should do is assess why the client is refusing to ambulate. The client might be fearful of falling, given that a prior fall resulted in a fractured hip. Following this assessment, the nurse could plan interventions that would facilitate ambulation, such as controlling pain and reducing the fear of falling.
D) It is premature to notify the healthcare provider.
Page Ref: 977
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with a hip fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

WwW.TeSm.Ws

5) A client with a BMI of 35 is recovering from total hip replacement surgery and experiencing pain that is exacerbated with movement. The client says to the nurse, "I live alone. How will I ever be able to return to my home?" For which problem should the nurse plan care for this client?

A) Excess body weight
B) Acute pain
C) Compromised physical mobility
D) Stress overload

Answer: B

Explanation: A) Excess body weight is not the priority.

B) Unless this pain is controlled, the client will not be able to participate in care to heal after the surgery.

C) The client is recovering from surgery and will have compromised physical mobility but this isn't the reason the client is asking about care needed after discharge.

D) There is no evidence that the client is overloaded with stress.

Page Ref: 976

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with a hip fracture.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

6) An older adult client is recovering from a fractured hip and will be staying with an adult child. Which statements indicate that discharge teaching provided to the client was effective? **Select all that apply.**
A) "I have signed a contract with Lifeline."
B) "We are removing the area rugs in the hallway."
C) "I've borrowed a toilet seat riser from the equipment closet."
D) "I will be sure to take oxycodone before I go downstairs in the morning."
E) "I can help with housework while I'm staying at my child's house."
Answer: A, B, C
Explanation: A) The use of an emergency alert service would be appropriate.
B) Picking up loose area rugs can help decrease the risk of falls.
C) A toilet seat riser would be appropriate.
D) Pain medication should not be taken when there is a risk of a fall, particularly prior to going down a set of stairs.
E) Many housework tasks will be inappropriate.
Page Ref: 978
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with a hip fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

7) The nurse is evaluating care provided to a client recovering from hip replacement surgery. Which documentation indicates that the client has achieved the expected outcome for pain management?

A) The client states pain is a 6 on a numeric pain scale of 0 to 10 prior to evening care.
B) The client is crying and requesting pain medication prior to morning care.
C) The client is using a PCA pump around the clock and rates pain as a 2 on a numeric pain scale of 0 to 10.
D) The client refuses pain medication prior to physical therapy. Pain is rated as a 7 on a numeric pain scale of 0 to 10.

Answer: C

Explanation: A) A pain rating of 6 on a scale of 0 to 10 does not indicate that pain is being effectively managed.

B) Crying and requesting pain medication does not indicate pain is being managed.

C) Using the PCA pump and having a pain rating of 2 on a 0-to-10 scale indicates pain is being managed.

D) A pain level of 7 on a scale of 0 to 10 does not indicate effective pain management.

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with a hip fracture.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

8) An older adult client experiences a hip fracture. Which surgical procedure should the nurse anticipate?
A) Total hip replacement
B) Open reduction and external fixation
C) Arthroplasty
D) Open reduction and internal fixation
Answer: D
Explanation: A) A total hip replacement is generally performed only when severe arthritis or an underlying bone condition is present.
B) Open reduction and external fixation is not a surgical option for a fractured hip.
C) Arthroplasty is generally performed only when severe arthritis or an underlying bone condition is present.
D) Open reduction and internal fixation is the preferred surgical procedure to repair a fractured hip for older adult clients.
Page Ref: 975
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a hip fracture.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

9) A client is recovering from surgery to repair a fractured hip. Which actions by the nurse may reduce this client's risk for osteomyelitis in the postoperative period? **Select all that apply.**
A) Assess for pain every 1-2 hours.
B) Use sterile technique for dressing changes.
C) Assess wound for size, color, and drainage.
D) Administer antibiotics as prescribed.
E) Administer anticoagulants as prescribed.
Answer: B, C, D
Explanation: A) Assessing for pain every 1-2 hours is appropriate for pain management.
B) Interventions that can reduce the client's risk for infection include using sterile technique for dressing changes.
C) Interventions that can reduce the client's risk for infection include assessing the wound for size, color, and drainage.
D) Interventions that can reduce the client's risk for infection include administering antibiotics as prescribed.
E) Administering anticoagulants reduces the risk for deep vein thrombosis (DVT).
Page Ref: 977
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with a hip fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

10) A client having surgery for a fractured hip will receive careful attention to preserve the epiphyseal plate. Which client will require this precaution during surgery?
A) A postmenopausal client with paraplegia
B) A 32-year-old male who is a competitive body builder
C) A prepubescent female who is a vegetarian
D) An 85-year-old client with osteoporosis
Answer: C
Explanation: A) Epiphyseal plates are not an issue for a postmenopausal client with paraplegia.
B) Epiphyseal plates are not an issue for a 32-year-old client.
C) Epiphyseal plates are unique joints that produce growth of bone length in children. There is an epiphyseal plate that lies between the head and neck of the femur that must be preserved during hip surgery in pediatric clients to prevent obstruction of bone growth. The prepubescent female is young enough to have an epiphyseal plate.
D) Epiphyseal plates are not an issue for an 85-year-old client.
Page Ref: 976
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Differentiate considerations for care of patients with hip fractures across the lifespan.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

11) An adult client is recovering from an open reduction and internal fixation of a fractured hip. Which statement indicates that discharge teaching provided to this client was effective? **Select all that apply.**

A) "I will use my abduction pillow while sleeping to maintain proper hip alignment."
B) "I will use a high toilet seat to prevent excess flexion of my hip."
C) "I only need to use my walker during physical therapy appointments."
D) "I will take my prescribed ibuprofen to decrease the risk for deep vein thrombosis."
E) "I might experience bruising because of the warfarin I've been prescribed."
Answer: A, B, E
Explanation: A) The client should be instructed to use an abduction pillow.
B) The client should be instructed to use a high toilet seat to prevent excessive hip flexion.
C) The nurse should remind the client to use the walker at all times until told otherwise.
D) Warfarin, not ibuprofen, is prescribed to decrease the risk for deep vein thrombosis.
E) The client should be instructed that warfarin increases the risk for bruising.
Page Ref: 977
Cognitive Level: Evaluating
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Apply the nursing process in providing culturally competent care to an individual with a hip fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

12) In which way would the nurse categorize a hip fracture that occurs in the trochanter region?
A) Intracapsular
B) Intercapsular
C) Extracapsular
D) Subcapsular
Answer: C
Explanation: A) Intracapsular hip fractures occur at the femoral head and neck within the capsule of the hip joint.
B) The term *intercapsular* is not used to describe a fracture of the hip.
C) Extracapsular hip fractures occur within the trochanter region, which is between the neck and diaphysis of the femur.
D) *Subcapsular* is not used to describe a fracture of the hip.
Page Ref: 928
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Describe the pathophysiology of hip fractures.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

13) For non-elderly adult clients who fracture a hip, for which reason is internal fixation or casting of the fracture generally preferred over hip replacement?
A) Internal fixation or casting is preferred because it does not disturb the client's epiphyseal plate.
B) Internal fixation or casting is preferred because of the lower risk of deep vein thrombosis.
C) Internal fixation or casting is preferred because of the shorter recovery time.
D) Internal fixation or casting is preferred because of the limited longevity of hip prostheses.
Answer: D
Explanation: A) Protection of the epiphyseal plate is not a concern in adult clients, because they no longer have epiphyseal plates.
B) Internal fixation has the same risk of deep vein thrombosis and other surgical approaches.
C) Internal fixation has the same recovery time as other surgical approaches.
D) Non-elderly adults are likely to live beyond the decade or so anticipated lifespan of a replacement hip. Internal fixation and casting are the preferred treatment methods for these clients because hip replacement may eventually necessitate revision surgery, which carries a greater level of risk than the initial hip replacement surgery.
Page Ref: 975
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 13.C. Analyze hip fractures as they relate to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a hip fracture.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with a hip fracture.

Exemplar 13.D Multiple Sclerosis

1) A client with multiple sclerosis has an acute onset of visual changes, fatigue, and leg weakness. The client states that the last time this happened, recovery occurred in a few weeks. Which classification of multiple sclerosis is the client experiencing?
A) Progressive-relapsing
B) Secondary-progressive
C) Relapsing-remitting
D) Primary-progressive
Answer: C
Explanation: A) Progressive-relapsing MS involves a steady worsening of disease with acute relapses.
B) Secondary-progressive MS begins as relapsing-remitting but becomes worse between exacerbations.
C) Relapsing-remitting MS is characterized by clearly defined flare-ups with worsening neurological function followed by periods of partial or complete remission with few or no symptoms.
D) Primary-progressive MS involves slow but nearly continuous worsening of the disease from the time of onset with no distinct remissions.
Page Ref: 980
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Identify the clinical manifestations of MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

2) A young adult client complains of blurred vision and muscle spasms that have come and gone over the past several months. The physician suspects that the client has multiple sclerosis. Which information in the client's history would the nurse recognize as a risk factor for MS?
A) Male sex
B) Native American descent
C) Lives north of the equator
D) Takes a vitamin D supplement daily
Answer: C
Explanation: A) Risk factors for MS include being female.
B) There is no evidence that Native American descent increases the risk for MS.
C) Individuals who live farther from the equator and are exposed to less sunlight are more likely to develop MS.
D) Taking a vitamin D supplement may decrease the risk.
Page Ref: 980
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Compare the risk factors for and prevention of MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

3) A client with a history of relapsing-remitting multiple sclerosis (MS) is pregnant with a first child. Which intervention would be indicated for this client?
A) Suggest the client seek reproductive counseling.
B) Tell the client to expect a period of remission after delivery.
C) Instruct the client to expect an exacerbation of symptoms while pregnant.
D) Discuss the client's options for pain control during labor, as contractions will be especially severe.
Answer: A
Explanation: A) A definite genetic cause of MS has not been established; however, studies suggest that genetic factors make some individuals more susceptible to the disorder than others. Also, some medications used in the treatment of MS can be harmful to a fetus. Because of this, reproductive counseling would be recommended for this client.
B) There is a slightly increased relapse rate postpartum.
C) Pregnancy often brings about remission (not exacerbation) of MS.
D) The strength of uterine contractions in a client with MS is not severe, and because clients often have lessened sensation, labor may be almost painless.
Page Ref: 986
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Differentiate considerations for care of patients with MS across the lifespan.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

4) A client with relapsing-remitting multiple sclerosis (MS) reports leg spasms and blurred vision; however, the greatest issue is being tired. Which problem should the nurse use to plan care for this client?
A) Fatigue
B) Inadequate coping skills
C) Inadequate role performance
D) Inability to perform self-care
Answer: A
Explanation: A) Because the client reports feeling tired, the problem of fatigue would be the priority.
B) There is no evidence that the client is unable to cope with being tired.
C) There is no evidence that the client is unable to perform expected roles.
D) There is no evidence that the client is unable to perform self-care because of being tired.
Page Ref: 987
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

5) A client with multiple sclerosis is frustrated with eating because of hand and arm spasms that prevent the proper use of utensils. Which intervention should the nurse implement to best assist this client?
A) Consult with the occupational therapist regarding assistive devices for meals.
B) Counsel the client to select finger foods for meals.
C) Plan time to feed the client.
D) Consult with the physical therapist regarding hand and arm exercises.
Answer: A
Explanation: A) Because the ability to feed oneself is essential to positive self-concept and self-esteem, the nurse should consult with the occupational therapist regarding devices the client can use to maintain independence at mealtimes.
B) The nurse should not counsel the client to select finger foods for meals.
C) The nurse should not feed the client.
D) The nurse might consult the physical therapist regarding hand splints, but hand and arm exercises might not be beneficial for this client.
Page Ref: 988
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

6) A client with multiple sclerosis (MS) is observed transferring from the bed to a motorized wheelchair and applying splints to the lower extremities before entering the bathroom to perform morning self-care. Which conclusion should the nurse make regarding this observation?
A) The client uses assistive devices to optimize autonomy.
B) The client should be instructed to conduct morning care before applying splints to the lower extremities.
C) The client is dependent on assistive devices.
D) The client should be advised to avoid use of a motorized wheelchair when possible.
Answer: A
Explanation: A) The nurse observed the client independently transfer from the bed to a motorized wheelchair, apply splints, and enter the bathroom to perform morning self-care. This is evidence that the client uses assistive devices to optimize autonomy.
B) Applying the splints supports independence with morning care.
C) The assistive devices support the client's independence.
D) The wheelchair supports the client's independence.

Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

7) A client with multiple sclerosis is prescribed diazepam (Valium). Which assessment finding indicates that this medication is effective for the client?
A) Muscle spasticity is reduced.
B) Blood glucose level is within normal limits.
C) The client states that muscles are weak.
D) Ophthalmologic examination shows no evidence of cataracts.
Answer: A
Explanation: A) Diazepam (Valium) is a muscle relaxant commonly used for clients with multiple sclerosis. Evidence of medication effectiveness would be an observed reduction in muscle spasticity.
B) Glucose intolerance would be assessed if the client were prescribed an adrenal corticosteroid. Cataract development is also a side effect of adrenal corticosteroids.
C) Diazepam (Valium) does not cause muscle weakness.
D) Cataract development is a side effect of adrenal corticosteroids.

Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with MS.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

8) The nurse is planning care for a client with multiple sclerosis. Which intervention would address the problem of fatigue?
A) Encourage increased activity.
B) Schedule physical therapy three times a day.
C) Plan activities with sufficient rest periods between them.
D) Group activities together so care will not be interrupted.
Answer: C
Explanation: A) Interventions to address fatigue include assisting the client in setting priorities regarding activities.
B) Physical therapy three times a day may be too aggressive for this client.
C) Interventions to address fatigue include arranging activities to include rest periods between them.
D) Activities should not be grouped together.
Page Ref: 988
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

9) The nurse is caring for several clients from various cultural backgrounds. Which client would the nurse assess as having the highest risk for multiple sclerosis?
A) A Brazilian woman with chronic parasitic infestation
B) A Hispanic man with colonized methicillin-resistant *Staphylococcus aureus* (MRSA)
C) A Northern Canadian woman who has smoked for 25 years
D) An African man in his 20s who has a vitamin D deficiency
Answer: C
Explanation: A) Factors that lower the risk of MS include living closer to the equator (as is the case for the Brazilian client).
B) Factors that lower the risk of MS include being male.
C) The Northern Canadian woman who smokes has three risk factors for MS: female gender, living farthest from the equator, and smoking.
D) Factors that lower the risk of MS include being male.
Page Ref: 980
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Compare the risk factors for and prevention of MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

10) An adult client recently diagnosed with multiple sclerosis (MS) reports engaging in vigorous exercise on a regular basis. Which statements contain the correct information to give this client when answering specific questions about lifestyle? **Select all that apply.**
A) "Hyperbaric oxygen treatment is recommended prior to vigorous physical exercise."
B) "You will tolerate exercise better in an air-conditioned room."
C) "Acupuncture may benefit some of your symptoms."
D) "Drinking cold water is recommended during exercise."
E) "You will be able to maintain your current exercise schedule."
Answer: B, C, D
Explanation: A) Hyperbaric oxygen therapy carries more risk than benefit.
B) Exercising in a cold room helps keep body temperature down.
C) Acupuncture has low risk and may be beneficial for some symptoms of MS.
D) Drinking cold beverages help keep body temperature down.
E) It is unlikely that a newly diagnosed client with MS will be able to tolerate regular vigorous exercise.
Page Ref: 986
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

11) During an outpatient clinic follow-up appointment, a client with multiple sclerosis (MS) has lab tests completed. The results show elevated levels of aspartate aminotransferase (AST), serum glutamic-oxaloacetic transaminase (SGOT), alanine aminotransferase (ALT), serum glutamic-pyruvic transaminase (SGPT), and alkaline phosphatase (ALP). The nurse recognizes that these elevated enzyme levels are a potential adverse effect of which medications? **Select all that apply.**
A) Interferon beta-1a (Avonex)
B) Teriflunomide (Aubagio)
C) Glatiramer acetate (Copaxone)
D) Mitoxantrone (Novantrone)
E) Fingolimod (Gilenya)
Answer: A, B
Explanation: A) AST, SGOT, ALT, SGPT, and ALP are liver enzymes that are monitored to detect adverse responses to interferon beta-1a (Avonex).
B) AST, SGOT, ALT, SGPT, and ALP are liver enzymes that are monitored to detect adverse responses to teriflunomide (Aubagio).
C) Glatiramer acetate (Copaxone) does not affect the liver.
D) Mitoxantrone (Novantrone) does not affect the liver.
E) Fingolimod (Gilenya) does not affect the liver.
Page Ref: 984
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

WwW.TeSt.Ws

12) The nurse is teaching the parents of a client who was recently diagnosed with multiple sclerosis (MS) about what to expect as their child's condition progresses. Which statement by the parents indicates the need for further instruction?
A) "My child is at increased risk for seizures because of the MS diagnosis."
B) "It's not unusual for kids with MS to have problems with their schoolwork."
C) "MS usually progresses faster in children than in adults."
D) "Making friends may be more difficult for our child because of the MS."
Answer: C
Explanation: A) Children with MS often experience seizures related to the diagnosis.
B) Children with MS often have reduced academic performance.
C) MS usually progresses more slowly in children than in adults.
D) Children with MS often experience difficulty in family and peer relationships.
Page Ref: 986
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Evaluation
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Differentiate considerations for care of patients with MS across the lifespan.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

13) Which category of multiple sclerosis (MS) is characterized by a slow but nearly continuous worsening of the disease from the time of onset with no distinct remissions?
A) Relapsing-remitting
B) Progressive-relapsing
C) Primary-progressive
D) Secondary-progressive
Answer: C
Explanation: A) Relapsing-remitting MS is characterized by clearly defined flare-ups with worsening neurological function followed by periods of partial or complete remission with few or no symptoms.
B) Progressive-relapsing MS involves a steady worsening of disease with acute relapses.
C) Primary-progressive MS involves slow but nearly continuous worsening of the disease from the time of onset with no distinct remissions.
D) Secondary-progressive MS begins as relapsing-remitting but becomes worse between exacerbations.
Page Ref: 980
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Identify the clinical manifestations of MS.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

14) Which assessment finding would be classified as a secondary symptom of multiple sclerosis (MS)?
A) Pressure sores
B) Urinary retention
C) Depression
D) Unsteady gait
Answer: A
Explanation: A) Because pressure sores result from primary symptoms such as muscle weakness and inability to ambulate, they would be considered a secondary symptom.
B) Urinary retention is a primary symptom of MS.
C) Depression is a tertiary symptom (because it involves a psychosocial problem).
D) Unsteady gait is a primary symptom of MS.
Page Ref: 981
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Identify the clinical manifestations of MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

15) Which information about symptoms indicates that a client with multiple sclerosis (MS) is experiencing an exacerbation?
A) Last at least 1 week and are separated from a previous attack by at least 30 days
B) Last at least 24 hours and are separated from a previous attack by at least 30 days
C) Last at least 2 weeks and are separated from a previous attack by at least 2 months
D) Last at least 30 days and are separated from a previous attack by at least 2 months
Answer: B
Explanation: A) A true exacerbation does not last for a week.
B) A true exacerbation must last at least 24 hours and must be separated from the previous attack by at least 30 days.
C) A true exacerbation does not last for 2 weeks.
D) A true exacerbation does not last for 30 days.
Page Ref: 981
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Identify the clinical manifestations of MS.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

16) Which medication is used to treat tertiary symptoms of multiple sclerosis (MS)?
A) Bupropion
B) Ciprofloxacin
C) Magnesium hydroxide
D) Glatiramer
Answer: A
Explanation: A) Tertiary symptoms of MS relate to psychosocial problems, such as relationship difficulties, loss of a job because of decreased performance, or hopelessness. Bupropion (an antidepressant) would be used to treat a tertiary symptom (depression).
B) Ciprofloxacin (an antibiotic) would be used to treat the secondary symptoms of infection.
C) Magnesium hydroxide (a laxative) would be used to treat the secondary symptoms of constipation.
D) Glatiramer (Copaxone) would be used to treat the primary symptoms of MS.
Page Ref: 985
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.D. Analyze multiple sclerosis (MS) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with MS.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with multiple sclerosis.

Exemplar 13.E Osteoarthritis

1) The nurse is providing teaching to the client recently diagnosed with osteoarthritis. Which statement by the nurse is correct?
A) "Osteoarthritis is most commonly seen in thin, small-built female clients."
B) "Osteoarthritis is a result of joint inflammation."
C) "Osteoarthritis occurs due to erosion of cartilage in the joints."
D) "Osteoarthritis is a metabolic bone disease."
Answer: C
Explanation: A) Thin, small-built female clients are at increased risk for osteoporosis, not osteoarthritis.
B) Joint inflammation is a characteristic of rheumatoid arthritis, not osteoarthritis.
C) Osteoarthritis is characterized by progressive erosion of the cartilage within joints.
D) Osteoarthritis is not a metabolic bone disease; examples of such diseases include osteoporosis, osteomalacia, and Paget disease.
Page Ref: 991
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Describe the pathophysiology of OA.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

2) The nurse is caring for a client with osteoarthritis. Which factor in the client's history and physical assessment would the nurse recognize as a risk factor for developing this condition?
A) Body mass index of 36.5
B) History of esophageal reflux disease
C) Client plays tennis three times each week
D) Blood pressure of 136/78 mmHg
Answer: A
Explanation: A) Obesity increases the risk of developing osteoarthritis (OA), because the added weight increases stress on weight-bearing joints, causing the joints to wear down more quickly. This client has a body mass index of 36.5, which is considered obese.
B) Esophageal reflux is not associated with OA.
C) Moderate recreational exercise (such as tennis three times per week) has been shown to decrease the chance of developing OA and slow the progression of manifestations when OA is present.
D) Blood pressure is not a known risk factor for the development of OA.
Page Ref: 991
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Compare the risk factors for and prevention of OA
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

3) An older adult client with bilateral osteoarthritis of the knees tells the nurse, "I know I need to lose weight, but exercising makes my knees ache." Which instruction should the nurse provide to this client?
A) "You should discuss knee replacement surgery with your physician."
B) "Exercising the muscles in your legs might be hard now, but over time, it will help protect your knees."
C) "Try eating a reduced-calorie diet for several months before attempting exercise."
D) "You need to stretch your muscles, because stretching is the only form of exercise that improves osteoarthritis."
Answer: B
Explanation: A) The client may or may not want to have knee replacement surgery.
B) Encouraging exercise is an important aspect of nursing care for clients with osteoarthritis (OA). Exercise can increase flexibility, improve blood flow, and help clients lose weight. Over time, these factors can help protect the joints against further deterioration and pain.
C) The nurse should not counsel the client to follow a reduced-calorie eating plan for several months before attempting exercise.
D) Stretching is just one type of exercise that will benefit clients with OA. The other components, strengthening and aerobic exercise, can be obtained through walking, swimming, and isometric, isotonic, and resistive exercises.
Page Ref: 991
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Compare the risk factors for and prevention of OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

WwW.TeSt.Ws

4) The nurse is planning care for a client with osteoarthritis (OA). Which problem would have the highest priority?
A) Fatigue
B) Chronic pain
C) Difficulty with coping
D) Altered body image
Answer: B
Explanation: A) Fatigue is not an identified problem for a client with OA.
B) The client with OA will experience pain that may become progressively worse. The problem of chronic pain should be the priority.
C) There is no evidence that the client is having difficulty coping.
D) There is no evidence that the client has a problem with body image.
Page Ref: 996
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

5) The nurse is planning care for a client with osteoarthritis of the hip. Which intervention would be appropriate for this client?
A) Provide moist heat packs to the affected joint 3 times each day.
B) Instruct the client on the importance of strict bedrest.
C) Provide nonsteroidal anti-inflammatory drugs (NSAIDs) when pain becomes severe.
D) Provide opioid pain medication as prescribed.
Answer: A
Explanation: A) Interventions appropriate for a client with osteoarthritis (OA) include NSAIDs, moist heat, active range-of-motion exercises, proper posture and body mechanics, and assistive devices to safely maintain independence with activities of daily living.
B) The client should be encouraged to be mobile, not on strict bedrest.
C) NSAIDs are most effective if taken before the pain is severe.
D) Opioid medication is not typically prescribed for the treatment of OA.
Page Ref: 992
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

6) The nurse is evaluating care provided to a client with osteoarthritis (OA). Which client statement indicates to the nurse that interventions for OA have been successful?
A) "I had to take early retirement and now stay at home all day and rest my legs."
B) "I am sleeping throughout the night and have not missed any work because of knee pain."
C) "I am moving from my two-story house into the first floor of my daughter's home so I won't have to walk steps anymore."
D) "I changed my work hours so now I work part time and have a nursing assistant who helps me bathe twice a week at home."
Answer: B
Explanation: A) A client who retires early and stays at home all day is also experiencing a significant impact in lifestyle.
B) Expected outcomes for the care of a client with OA include independence with activities of daily living, minimal lifestyle impact because of OA, and controlled pain that allows for rest and sleep. Of the client statements provided, only the one about improved sleep and pain not interfering with work indicates achievement of these outcomes.
C) A client who is moving in with a daughter is experiencing significant lifestyle impact.
D) A client who changes work hours and has a nursing assistant for bathing is experiencing a reduction in activities of daily living and a significant impact in lifestyle.
Page Ref: 997
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

7) A client with osteoarthritis tells the nurse she has difficulty walking to the bathroom first thing in the morning. Which nursing action would assist this client?
A) Suggesting a family member provide the client with a bedpan
B) Discussing the option of residing in an assisted-living facility
C) Consulting with physical therapy for an assistive walking device such as a walker or cane
D) Suggesting the client use a bedside commode at home
Answer: C
Explanation: A) The use of a bedpan may help with the immediate need to use the bathroom, but the client will still have difficulty ambulating in the morning.
B) The option of residing in an assisted-living facility might be premature for this client.
C) Assistive devices are items used to maintain, increase, or improve function. The client describes difficulty walking to the bathroom in the morning. The best intervention to help this client would be to consult with physical therapy for an assistive walking device such as a walker or cane.
D) The use of a bedside commode may help with the immediate need to use the bathroom, but the client will still have difficulty ambulating in the morning.
Page Ref: 997
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

WwW.TeSm.Us

8) A client with chronic hip pain is diagnosed with osteoarthritis. Which instruction regarding home safety is most appropriate for the nurse to provide to this client?

A) Walk up and down the steps at home as much as possible.

B) Rest in a recliner.

C) Place scatter rugs in high-traffic areas.

D) Install grab bars in the bathroom near the commode and in the shower.

Answer: D

Explanation: A) The client should be instructed not to overuse the affected joints with excessive stair climbing.

B) The client should also be instructed to sit in a straight-back chair, avoid slumping, and avoid use of a recliner.

C) Scatter rugs are a hazard to mobility and should be avoided.

D) The client should be encouraged to install grab bars in the bathroom near the commode and in the shower.

Page Ref: 997

Cognitive Level: Applying

Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with OA.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

9) A client seeking treatment for severe knee pain has worked in a factory for 30 years in a position requiring repetitive lifting and carrying of 20- to 40-pound boxes. Based on the client's history, the nurse should anticipate which initial recommendation from the interprofessional healthcare team?

A) Joint replacement surgery
B) Pharmacologic therapy
C) Referral for a disability application
D) Intermittent use of a cane

Answer: B

Explanation: A) Joint replacement should be delayed as long as possible because artificial joints often require replacement within 15-20 years.

B) Pharmacologic therapy would be the most likely initial intervention. Acetaminophen, nonsteroidal anti-inflammatory drugs (NSAIDs), and joint injections are all possible options.

C) There is not enough information to determine whether applying for disability is appropriate at this time.

D) A cane is not indicated at this time.

Page Ref: 994

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with OA.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

10) A client with limited joint pain had synovial fluid analysis completed. Which response should the nurse make when asked what it means when the fluid has no uric acid crystals or bacteria?
A) "These test results mean that your joint pain is likely not caused by gout or septic arthritis."
B) "These test results mean that your joint pain is likely not related to any form of arthritis."
C) "These test results mean that your joint pain is likely caused by either rheumatoid arthritis or septic arthritis."
D) "These test results mean that your joint pain is likely caused by either cancer of the joint or gout."
Answer: A
Explanation: A) Gout is caused by the collection of uric acid crystals in a joint. The absence of uric acid crystals in the synovial fluid (joint fluid) makes gout unlikely. Septic arthritis is caused by infection, so the absence of bacteria makes sepsis unlikely.
B) This test does not rule out any form of arthritis.
C) This test does not rule out rheumatoid arthritis.
D) Although the nurse may provide information related to which conditions have been ruled out, providing a medical diagnosis is outside the nurse's scope of practice.
Page Ref: 993
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with OA.
MNL LO: Analyze the concept of mobility and its application to nursing care.

11) A client with osteoarthritis (OA) of the knees and hips returns for a 3-month follow-up visit with the provider. The nurse calculates that the client's body mass index (BMI) is now 22. The client reports starting a water aerobics and running program three times per week. The client is also using hot packs for edema for 20 minutes and cold packs for pain for 40 minutes daily. After evaluating the client's actions, which follow-up interventions should the nurse plan? **Select all that apply.**
A) Reinforce the correct use of hot packs.
B) Suggest the client replace running with a lower impact exercise.
C) Explain the risk of injury associated with use of cold packs.
D) Advise the client to continue weight loss.
E) Congratulate the client on starting water aerobics.
Answer: A, B, C, E
Explanation: A) The nurse should reinforce that hot packs are used to decrease pain.
B) The nurse should suggest that the client replace the high impact exercise of running with a lower impact exercise such as walking or biking.
C) The client should be informed that using cold packs for more than 30 minutes may cause skin injury.
D) The nurse should congratulate the client on the weight loss. Note, however, that a BMI of 22 is ideal, so continued weight loss should not be encouraged.
E) The nurse should congratulate the client on starting water aerobics because it is a low-impact exercise mode.
Page Ref: 992
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

12) The nurse is teaching the parents of a client who was recently diagnosed with osteoarthritis (OA) about their child's condition. Which statement by the parents indicates the need for further instruction?

A) "Our daughter's OA is likely related to a joint injury she sustained last year."

B) "Most kids with OA usually have only one or two affected joints."

C) "Because our daughter developed OA as a child, she is more likely to become disabled as a result of this condition."

D) "Our daughter may outgrow her OA as she ages."

Answer: C

Explanation: A) Juvenile OA is usually secondary to a congenital abnormality, genetic condition, or joint injury.

B) Juvenile OA typically occurs only in the one or two joints affected by the abnormality or injury.

C) Children with OA are less likely to become disabled.

D) Children with OA may outgrow the condition as they age. Further instruction is not needed.

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Differentiate considerations for care of patients with OA across the lifespan.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

13) Which treatment option would least likely be considered for a 71-year-old client with osteoarthritis (OA)?
A) Physical therapy
B) Administration of nonsteroidal anti-inflammatory drugs (NSAIDs)
C) Weekly tai chi sessions
D) Administration of narcotics
Answer: B
Explanation: A) Physical therapy is especially important in older adults to maintain or improve mobility of joint(s).
B) NSAIDs can create problems for older adults due to their effects on the kidneys.
C) Complementary health approaches such as tai chi may assist older adults in increasing mobility and reducing pain levels.
D) Narcotics are a second-line choice, because they are safer than NSAIDs for older adults.
Page Ref: 996
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Differentiate considerations for care of patients with OA across the lifespan.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

14) Which procedure used in the treatment of osteoarthritis (OA) involves removing a small amount of bone at the articulating surface of the joint and fitting a metal replacement over the end of the bone?
A) Osteotomy
B) Arthroplasty
C) Arthroscopy
D) Joint resurfacing
Answer: D
Explanation: A) Osteotomy involves surgical removal of a wedge of bone above or below the joint to realign the joint and shift the weight away from the damaged portion of the joint.
B) Arthroplasty is total joint replacement, in which a surgeon removes the damaged joint surfaces and replaces them with plastic, metal, or ceramic prostheses.
C) Arthroscopy entails insertion of a small fiber optic light source, magnifying lens, and camera into the joint to visualize the joint structures.
D) In joint resurfacing, a small amount of bone is removed at the articulating surface of the joint and a metal replacement is fitted over the end of the bone.
Page Ref: 993
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

15) Which term is used to describe osteoarthritis (OA) that is caused by an underlying condition, such as injury, congenital malformation, or metabolic disease?
A) Idiopathic
B) Secondary
C) Localized
D) Generalized
Answer: B
Explanation: A) Secondary OA is caused by an underlying condition, such as injury; congenital malformation; metabolic, endocrine, or neuropathic disease; or other medical cause.
B) Secondary OA is caused by an underlying condition, such as injury; congenital malformation; metabolic, endocrine, or neuropathic disease; or other medical cause.
C) Idiopathic OA can be further divided into localized which affects one or two joints.
D) Idiopathic OA can be further divided into generalized which affects three or more joints.
Page Ref: 991
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Describe the etiology of OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

16) Which procedure would be most appropriate to repair a finger joint that is affected by severe osteoarthritis (OA)?
A) Osteotomy
B) Joint resurfacing
C) Joint fusion
D) Internal fixation
Answer: C
Explanation: A) Osteotomy is usually performed on the knee and hip and entails surgical removal of a wedge of bone above or below the joint to realign the joint and shift the weight away from the damaged portion of the joint.
B) Joint resurfacing, which involves removing a small amount of bone at the articulating surface of the joint and fitting a metal replacement over the end of the bone, is often performed for hip and shoulder joints.
C) Joint fusion is used to permanently fuse two or more bones together at a joint using pins, plates, screws, and rods. It is often recommended for badly damaged smaller joints, such as the spine, wrist, ankle, finger, or toe.
D) Internal fixation is used to fix fractures, not to address osteoarthritis.
Page Ref: 993
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

WwW.TeSM.Ws

17) Clients with osteoarthritis (OA) can reduce their risk of further joint damage by doing which action?
A) Applying topical analgesic creams as prescribed
B) Avoiding movement of affected joints
C) Taking acetaminophen or nonsteroidal anti-inflammatory drugs (NSAIDs) before joint pain becomes severe
D) Receiving cortisone injections in affected joints no more than three times per year
Answer: D
Explanation: A) Applying topical analgesics reduces the pain of OA but does not reduce the risk of further joint damage.
B) Avoiding movement of affected joints does not reduce the risk of joint damage; rather, it worsens the effects of OA.
C) Taking acetaminophen and NSAIDs reduces the pain of OA but does not reduce the risk of further joint damage.
D) Because frequent use of corticosteroids can cause joint damage, clients should receive cortisone injections in affected weight-bearing joints no more than three or four times per year.
Page Ref: 995
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.E. Analyze osteoarthritis (OA) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with OA.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with osteoarthritis.

Exemplar 13.F Parkinson Disease

1) A client complains of a right-hand tremor, increasing weakness, and muscles that feel tight. The nurse notes that the client has poor voice volume and facial muscles that do not move easily. The nurse recognizes that these symptoms are consistent with which condition?
A) Parkinson disease
B) Spinal cord injury
C) Cerebrovascular accident
D) Multiple sclerosis
Answer: A
Explanation: A) Manifestations of Parkinson disease include unintentional tremor, slowed movements, low amplitude of speech, expressionless face, and muscle rigidity. The client is complaining of or exhibiting all these symptoms, suggesting a diagnosis of Parkinson disease.
B) These symptoms are not manifestations of spinal cord injury.
C) These symptoms are not manifestations of a cerebrovascular accident.
D) These symptoms are not manifestations of multiple sclerosis.
Page Ref: 99
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Identify the clinical manifestations of PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

2) A middle-aged female client says, "I have noticed a slight tremor in my left hand when it's at rest. I think I might have Parkinson disease because my mother had it." Which response by the nurse is the most appropriate?
A) "Having a close relative with Parkinson disease can increase your chance of developing it as well."
B) "You shouldn't worry too much, because Parkinson disease has a higher prevalence in males."
C) "It is unlikely that you have the same illness as your mother."
D) "You probably don't have Parkinson disease. Your mother was probably exposed to a toxin that caused her illness."
Answer: A
Explanation: A) Approximately 30% of the risk for PD is explained by genetics. Individuals with a first-line family member have a 2-3% increased risk of developing PD.
B) Men are at higher risk for PD, with 50% more men than women developing the disease, but this does not eliminate the client's risk of having the disease, especially given her mother's diagnosis.
C) The nurse should not tell the client it is unlikely she has the same illness as her mother.
D) Exposure to toxins is one theory for the development of the illness; however, the nurse has no way of knowing whether the client's mother was exposed to toxins or if that was the cause for her disease.
Page Ref: 999
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Compare the risk factors for and prevention of PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

3) A client with Parkinson disease (PD) ambulates with a shuffling gait and leans slightly forward. When seated, the client conducts a conversation, reads, and is able to self-feed without assistance. Which problem is a priority for this client?
A) Potential for falls
B) Compromised physical mobility
C) Impaired swallowing
D) Fear
Answer: B
Explanation: A) There is no evidence that the client has a potential for falls.
B) The client demonstrates a shuffled gait with forward leaning when ambulating. When seated, the client is able to converse, read, and self-feed. The problem with the highest priority would be compromised physical mobility.
C) There is no evidence that the client has impaired swallowing.
D) There is no evidence that the client has fear.
Page Ref: 1006
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

4) The nurse is planning care for a client with Parkinson disease (PD). Which nursing intervention for the spouse would best support the client's continued mobility?
A) Suggesting that the spouse use a blender to make foods easier for the client to swallow
B) Reviewing the client's medication administration schedule with the spouse
C) Instructing the spouse to ambulate the client at least four times a day
D) Instructing the spouse on proper turning and repositioning techniques
Answer: C
Explanation: A) Blending foods to aid with swallowing would not support physical mobility.
B) Reviewing the medication administration schedule would not support physical mobility.
C) Because exercise fosters not just mobility but also independence and self-esteem, the intervention that would be most appropriate is for the nurse to instruct the spouse to ambulate the client at least four times a day.
D) Instructing on turning and repositioning techniques would not support physical mobility.
Page Ref: 1007
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

5) The nurse is evaluating the care of a client with Parkinson disease (PD). Which finding indicates an improvement in the client's nutritional status?
A) The client filled out the menu card for each meal.
B) The client coughs frequently when drinking fluids.
C) The client was able to feed himself and had no weight change in 1 week.
D) The client had a 4-pound weight loss in 1 week.
Answer: C
Explanation: A) The client filling out the menu card does not indicate that the client actually consumed any of the meals.
B) If the client coughs frequently when drinking fluids, it could indicate that interventions to address nutritional status have not been effective.
C) The finding that the client was able to feed himself and had no weight change in 1 week is indicative of an improvement in nutritional status.
D) The client's losing 4 pounds in 1 week would not support an improvement in nutritional status.
Page Ref: 1008
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

6) The spouse of a client with Parkinson disease (PD) expresses frustration about trying to communicate with the client. Which action should the nurse take to facilitate communication between the client and spouse?
A) Recommend that the client and spouse learn sign language.
B) Suggest that the spouse obtain a hearing aid.
C) Consult with speech therapy for exercises to aid the client with speech and language.
D) Suggest the client and spouse communicating by writing.
Answer: C
Explanation: A) The spouse and client do not need to learn sign language in order to communicate.
B) The spouse does not need a hearing aid.
C) The best intervention would be to consult with speech therapy for exercises to aid the client with speech and language.
D) The client may or may not be able to write because of hand tremors, so it may not be appropriate for the nurse to suggest that the client and spouse communicate via writing.
Page Ref: 1001
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

7) The nurse instructs a client with Parkinson disease (PD) about levodopa/carbidopa. Which client statement indicates that this teaching has been effective?
A) "I should eat a high-protein diet when taking this medication."
B) "This medication can turn my urine and sweat dark.”
C) "I should take this medication with B vitamins.”
D) "Given enough time, this medication will cure my Parkinson disease."
Answer: B
Explanation: A) Clients should avoid eating protein-rich meals when taking this medication, as a high-protein diet may interfere with levodopa absorption from the GI tract.
B) A metabolite of levodopa may cause urine and sweat to be dark-colored.
C) The client should be instructed to not take vitamin products containing vitamin B_6 if taking levodopa without carbidopa.
D) There is no medication that is known to cure Parkinson disease.
Page Ref: 1003
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

8) The nurse completes a teaching session for a young adult client who was recently diagnosed with Parkinson disease (PD). Which client statement indicates this teaching has been effective?
A) "I could have prevented PD with diet and exercise."
B) "I probably have a genetic mutation that caused my PD."
C) "My brain contains too much of a chemical called dopamine."
D) "Most people with PD first experience symptoms when they are about my age."
Answer: B
Explanation: A) Dietary intake has not been definitively linked to development of PD.
B) Early-onset PD is likely due to a genetic mutation.
C) PD is associated with decreased dopamine levels in the brain, not an excess of dopamine.
D) Increasing age is a risk factor for the disease, and diagnosis as a young adult is uncommon.
Page Ref: 999
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility.
Apply the nursing process in providing culturally competent care to an individual with PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

9) A client is being evaluated for Parkinson disease (PD). Which findings on the Unified Parkinson Disease Rating Scale (UPDRS) would be considered positive for PD? **Select all that apply.**

A) Diarrhea
B) Dystonia
C) Retropulsion
D) Hyperphonia
E) Festination

Answer: B, C, E

Explanation: A) Diarrhea is not a symptom of PD.
B) Positive findings for PD include dystonia (twisting and repetitive movements).
C) Positive findings for PD include retropulsion (the tendency to fall backward).
D) Hyperphonia (loud voice) is not a symptom of PD.
E) Positive findings for PD include festination (rapid walking as if trying to run).

Page Ref: 999-1001, 1006

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Identify the clinical manifestations of PD.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

10) The interprofessional treatment team proposes interventions to improve and maintain physical function for an adult client with Parkinson disease (PD). Which interventions should be recommended? **Select all that apply.**
A) Low-intensity treadmill training
B) Walking barefoot indoors
C) Use of resistance bands
D) Active and passive range-of-motion exercises
E) High-intensity treadmill training
Answer: A, C, D, E
Explanation: A) The nurse should encourage clients to participate in an exercise program, especially a combination of walking and strength training.
B) Use of shoes with non-slip soles is advised.
C) Any type of exercise is beneficial for clients with PD.
D) Any type of exercise including active and passive range of motion should be encouraged.
E) Treadmill training should be encouraged.
Page Ref: 1005
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a Parkinson disease.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

11) The nurse is caring for a 30-year-old female client who was recently diagnosed with Parkinson disease (PD). Which statement should the nurse include in the teaching for this client?
A) "Having the early-onset form of PD puts you at greater risk for dementia."
B) "If you get pregnant, it is highly unlikely that you will be able to carry the baby to term."
C) "Given your age, your PD is likely to progress more slowly than it does for people who develop the condition later in life."
D) "You can continue using birth control pills, because PD medications do not have an impact on their efficacy."
Answer: C
Explanation: A) Clients with early-onset PD generally have lower rates of dementia than clients who develop the disease later in life.
B) Many women with PD have successfully carried healthy babies to full term.
C) Clients with early-onset PD generally have a slower disease progression than clients who develop the disease later in life.
D) The effect of PD medication on the efficacy of birth control pills is not known, so clients should be urged to consider other forms of contraception.
Page Ref: 1006
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility.
Apply the nursing process in providing culturally competent care to an individual with PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

12) Which assessment finding is least likely to be associated with Parkinson disease (PD)?
A) Restless leg syndrome
B) Cogwheel rigidity
C) Malignant hypertension
D) Pill-rolling
Answer: C
Explanation: A) Restless leg syndrome occurs in PD.
B) Cogwheel rigidity occurs in PD.
C) Malignant hypertension is not a clinical manifestation of PD.
D) Pill-rolling occurs in PD.
Page Ref: 999-1000
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Identify the clinical manifestations of PD.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

13) In clients with Parkinson disease, increasing doses of, and long-term exposure to, levodopa can cause which condition?

A) Dyskinesia
B) Insomnia
C) Hypertension
D) Compulsive behavior
Answer: A
Explanation: A) With increasing doses and long-term exposure, levodopa usually causes dyskinesia, which may become less tolerable for the client than the symptoms of PD.
B) Insomnia is not a side effect of levodopa.
C) Hypertension is not a side effect of levodopa.
D) Compulsive behavior is a side effect of dopamine antagonists, not levodopa.
Page Ref: 1002
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with Parkinson disease.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

14) For which reason is carbidopa prescribed with levodopa in clients with Parkinson disease (PD)?

A) Carbidopa minimizes the conversion of levodopa to dopamine within the brain, thus minimizing levodopa's unwanted side effects.

B) Carbidopa enhances levodopa's conversion to dopamine throughout the body, thus intensifying levodopa's effectiveness.

C) Carbidopa prevents levodopa from converting to dopamine until it reaches the brain, thus minimizing levodopa's unwanted side effects.

D) Carbidopa prevents levodopa's conversion to dopamine in the brain, thus intensifying levodopa's effectiveness.

Answer: C

Explanation: A) Carbidopa does not minimize the conversion of levodopa to dopamine within the brain, to reduce levodopa's unwanted side effects

B) Carbidopa does not enhance levodopa's conversion to dopamine throughout the body to intensify levodopa's effectiveness.

C) Levodopa is a natural chemical that can cross the blood—brain barrier and be converted directly to dopamine in the brain. Levodopa can also be converted to dopamine outside the brain, which leads to the most common side effects of nausea and orthostatic hypotension. Therefore, levodopa is almost always given in combination with carbidopa, which prevents levodopa from converting to dopamine until it reaches the brain.

D) Carbidopa prevents levodopa's conversion to dopamine in the brain; however, it is not done to intensify levodopa's effectiveness.

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 13.F. Analyze Parkinson disease (PD) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with PD.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

15) A client in the initial stages of Parkinson disease (PD) would most likely exhibit which symptom?
A) Bilateral rigidity
B) Unilateral tremors
C) Bilateral tremors
D) Unilateral rigidity
Answer: B
Explanation: A) Bilateral rigidity usually develops later in the course of the disease.
B) Motor symptoms associated with PD usually begin unilaterally, not bilaterally. For most clients, the earliest motor symptom is tremors.
C) Bilateral tremors develop later in the disease.
D) Rigidity usually develops later in the course of the disease.
Page Ref: 999
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with Parkinson disease.

Exemplar 13.G Spinal Cord Injury

1) An adolescent is brought into the emergency department (ED) with injuries sustained from a motor vehicle crash. Which goal is a priority while providing nursing care for this client?
A) Adequate urine output
B) Stable blood pressure
C) Continued stabilization of the neck and spinal cord
D) Insertion of an intravenous access line
Answer: C
Explanation: A) Assessment of urine output can be delayed.
B) Assessing blood pressure is an intervention for all clients brought into the emergency department.
C) The danger of death from a spinal cord injury is greatest when there is damage to, or transection of, the upper cervical region. All people who have sustained trauma to the spine should be treated as though they have a spinal cord injury by stabilizing the neck and spinal cord.
D) An intravenous access line is necessary, but stabilization of the neck and spinal cord is of first priority.
Page Ref: 1014
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 13.G. Analyze spinal cord injury (SCI) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with SCI.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

2) The school nurse is treating a school-age client who has fallen down a flight of stairs. The client is breathing but unconscious. After calling the ambulance, which action should the nurse take?
A) Open the airway using the head tilt maneuver.
B) Try to rouse the client by gently shaking the shoulders.
C) Protect the client's neck and head from any movement.
D) Place the client on the side to prevent aspiration.
Answer: C
Explanation: A) This client is breathing; however, if a change in respirations were to occur, the airway should be opened using the jaw thrust maneuver.
B) Rousing the client by shaking could cause damage to the spinal cord.
C) Guidelines for emergency care are avoiding flexing, extending, or rotating the neck; immobilization of the neck; securing the head; maintaining the client in the supine position; and transferring the client from the stretcher to the hospital bed with backboard in place. This client is unconscious, and the nurse must protect the neck from any (or any further) damage.
D) If the client vomits, the nurse should use the log-roll technique to turn the client while keeping the head, neck, and spine in alignment.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

WwW.TeSt.Ws

Learning Outcome: 13.G. Analyze spinal cord injury (SCI) as it relates to mobility. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with SCI.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

3) A client who sustained a cervical neck injury 2 days ago is demonstrating an irregular respiratory pattern with a rate of 8-10 breaths per minute. Based on this data, which problem is the priority?

A) Impaired physical mobility
B) Potential for autonomic dysreflexia
C) Ineffective breathing pattern
D) Impaired gas exchange

Answer: C

Explanation: A) The problem of impaired physical mobility can be addressed later.

B) The client's symptoms are not associated with autonomic dysreflexia.

C) Because the client sustained the neck injury 2 days prior, the full extent of the injuries cannot yet be determined. The client's rate of respirations should be between 12 and 20 breaths per minute. Because the client is breathing irregularly at a rate of 8-10 breaths per minute, the client may need assisted ventilation or a tracheostomy. The priority problem would be ineffective breathing pattern.

D) The problem of impaired gas exchange would be caused by the ineffective breathing pattern.

Page Ref: 1020-1021

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 13.G. Analyze spinal cord injury (SCI) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with SCI.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

4) The nurse is planning care for a client admitted with a high thoracic spinal cord injury. Which interventions would be appropriate for the potential for autonomic dysreflexia? **Select all that apply.**
A) Discuss future care needs when the client is discharged.
B) Increase fluids to 3000 mL per day.
C) Turn and reposition the client every 2 hours.
D) Assess for a full bladder.
E) Assess blood pressure every 2-3 minutes.
Answer: D, E
Explanation: A) Discussing future care needs when discharged is not a priority at this time.
B) There is no evidence to increase the client's fluids to 3000 mL per day.
C) Turning the client every 2 hours is not a priority at this time.
D) Ineffective perfusion can be caused by autonomic dysreflexia, which is an emergency that requires immediate assessment and intervention. Once the client's blood pressure has stabilized or decreased, the nurse can then assess for the stimuli that caused the episode, such as a full bladder.
E) Ineffective perfusion can be caused by autonomic dysreflexia, which is an emergency that requires immediate assessment and intervention. The nurse should continue to assess the client's blood pressure every 2-3 minutes in addition to elevating the head of the bed and removing tight clothing to encourage the pooling of blood in the extremities and decrease the blood pressure.
Page Ref: 1021
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 13.G. Analyze spinal cord injury (SCI) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with SCI.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

5) The nurse is evaluating the effectiveness of interventions to address a client's bowel and bladder dysfunction as a result of a spinal cord injury. Which finding would indicate that these interventions have been successful?
A) The client had two episodes of impacted stool over the last week.
B) The client is improving in ability to perform self-urinary catheterization.
C) The client is limiting fluids to reduce need to void.
D) The client has an indwelling urinary catheter and is provided with stool softeners every morning.
Answer: B
Explanation: A) A client who had two episodes of impacted stool over the last week is not progressing in bowel elimination habits.
B) An ideal outcome for the client with bowel and bladder dysfunction as a result of a spinal cord injury would be for the client to attain appropriate bowel and bladder elimination habits. If the client's ability to perform self-urinary catheterization is improving, the interventions can be considered successful.
C) A client who is limiting fluids to reduce the need to void is possibly hindering his health in order to avoid having to perform self-urinary catheterization.
D) A client with an indwelling urinary catheter who is receiving stool softeners every morning is not progressing toward appropriate bowel and bladder elimination habits.
Page Ref: 1022

WwW.TbSY.Ws

6) The nurse is evaluating the success of a bowel and bladder retraining program with a client who is recovering from a lower motor neuron spinal cord injury. Which observations indicate that this teaching has been successful? **Select all that apply.**

A) One episode of bladder incontinence in 8 hours
B) Client performs self-urinary catheterization every 4 hours while awake
C) Client transfers to use bedside commode after breakfast to evacuate bowels
D) Two episodes of impacted stool in 1 week
E) Client maintains a high-fluid, high-fiber diet

Answer: B, C, E

Explanation: A) Evidence that this training has not been successful includes an episode of bladder incontinence.

B) Evidence that a bowel and bladder retraining program for a client with a spinal cord injury has been successful includes the client performing self-urinary catheterization every 4 hours while awake.

C) Evidence that a bowel and bladder retraining program for a client with a spinal cord injury has been successful includes transferring to the bedside commode to evacuate bowels after breakfast.

D) Evidence that this training has not been successful includes the need to have impacted stool removed twice in 1 week.

E) Evidence that a bowel and bladder retraining program for a client with a spinal cord injury has been successful includes maintaining a high-fluid and high-fiber diet to prevent constipation.

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 13.G. Analyze spinal cord injury (SCI) as it relates to mobility. Apply the nursing process in providing culturally competent care to an individual with SCI.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

7) The nurse is caring for a client who sustained a gunshot wound below the level of T12, resulting in ipsilateral motor paralysis, ipsilateral loss of proprioception and vibratory sense, and contralateral loss of pain and temperature sensation. When planning care for this client, which interpretations of this data by the nurse are likely to be correct? **Select all that apply.**
A) The client's American Spinal Injury Association Impairment Scale score is A.
B) The spinal cord injury is incomplete.
C) These findings are consistent with Brown-Sequard syndrome.
D) Hemisection of the spinal cord is likely.
E) Some recovery of sensory function is likely.
Answer: B, C, D, E
Explanation: A) An American Spinal Injury Association (ASIA) Impairment Scale (AIS) score of A indicates a complete spinal cord injury where no sensory or motor function is preserved in the sacral segments S4-S5.
B) Hemisection of the spinal cord, usually caused by a penetrating trauma (gunshot, knife), causes sensory and motor deficits on opposite sides of the body because the spinal cord injury is incomplete.
C) These findings are consistent with Brown-Sequard syndrome, which has the best prognosis of all the incomplete spinal cord syndromes.
D) Hemisection of the spinal cord, usually caused by a penetrating trauma (gunshot, knife), causes sensory and motor deficits on opposite sides of the body because the spinal cord injury is incomplete.
E) Clients with incomplete SCI will have some return of function.

Learning Outcome: 13.G. Analyze spinal cord injury (SCI) as it relates to mobility. Identify the clinical manifestations of SCI.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

8) The nurse is presenting a talk on spinal cord injury for a community health fair. Which statement on the part of the attendees indicates that they understand the risk factors and prevention methods associated with spinal cord injury?
A) "There isn't much I can do to prevent a head injury when another vehicle hits my car."
B) "As long as my grandson wears a helmet, he will be safe on his motorcycle."
C) "I'm going to spend extra time discussing this talk with my college-age son because of his higher risk for spinal cord injury."
D) "Due to their elevated risk, I'd like you to present this talk to members of the local Native American population."
Answer: C
Explanation: A) Using a seat belt is a major preventive action for individuals who are involved in motor vehicle crashes.
B) Riding motorcycles increases the risk of spinal cord injuries, even when helmets are used.
C) The highest-risk population for spinal cord injuries is young adult males, including college-age men.
D) Native Americans are the ethnic group with the lowest risk of spinal cord injury.
Page Ref: 1013
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Learning Outcome: 13.G. Analyze spinal cord injury (SCI) as it relates to mobility. Compare the risk factors for, and prevention of, SCI.
MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

9) The nurse assesses a young adult client who was involved in a swimming accident that resulted in tetraplegia. The client makes eye contact with the nurse and states, "I'm going to beat this and walk out of here." Based on this statement, which problem should the nurse use to plan this client's care?
A) Potential for mental health problems
B) Impaired physical mobility
C) Inability to perform self-care
D) Potential for autonomic dysreflexia
Answer: A
Explanation: A) The client's statement is unrealistic and could lead to a mental health problem.
B) The client does have tetraplegia and impaired physical mobility; however, the expectation to walk is unrealistic. The issue with impaired physical mobility will be long-term and will need to be addressed over time.
C) The inability to provide self-care would not be the priority.
D) There is no evidence of autonomic dysreflexia.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

W W . T B S M . W S

10) A female client who sustained a spinal cord injury (SCI) several years ago tells the nurse she is interested in becoming pregnant. She asks the nurse for more information about how her SCI might impact a potential pregnancy. Which statement should the nurse make in response?

A) "Women with SCI should avoid pregnancy, because it puts too much stress on their bodies and can exacerbate their injuries."

B) "If you become pregnant, your risk for autonomic dysreflexia will likely decrease."

C) "The good news is that none of the medications used in the treatment of SCI are known to have detrimental effects on the fetus."

D) "Should you have a baby and opt to breastfeed, you may experience an increase in muscle spasticity."

Answer: D

Explanation: A) Women with SCI are considered to be "high risk" during pregnancy, but that does not mean pregnancy should be avoided.

B) Pregnant women are at higher risk for autonomic dysreflexia, especially during labor and delivery.

C) Many women are unable to continue taking prescribed medications during pregnancy due to the potential harm they pose to the fetus.

D) New mothers must also consider the effects of their SCI on breastfeeding; muscle spasticity may increase during breastfeeding, and women with limited sensation in their breasts may have reduced milk production.

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation

Learning Outcome: 13.G. Analyze spinal cord injury (SCI) as it relates to mobility. Differentiate considerations for care of patients with SCI across the lifespan.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

11) Which client is at highest risk for autonomic dysreflexia?
A) A client with an injury to T9
B) A client with an injury to C7
C) A client with an injury to L2
D) A client with an injury to S1
Answer: B
Explanation: A) Autonomic dysreflexia usually occurs in clients with injuries about T6.
B) Autonomic dysreflexia is the abrupt onset of excessively high blood pressure as the result of an overactive autonomic nervous system; it usually occurs in clients who have injuries above T6.
C) Autonomic dysreflexia usually occurs in clients with injuries above T6.
D) Autonomic dysreflexia usually occurs in injuries above T6.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

12) In which way should the nurse categorize a client with permanent paralysis of the trunk, arms, and legs?

A) Tetraplegia
B) Paraplegia
C) Spinal shock
D) Complete spinal cord injury (SCI)

Answer: A

Explanation: A) Tetraplegia (also called quadriplegia) is paralysis of the upper and lower limbs and trunk.

B) Paraplegia is paralysis of all or part of the trunk, legs, and pelvic organs.

C) Spinal shock is a temporary condition characterized by spinal cord swelling; decreased blood flow and blood pressure; and complete loss of motor function, spinal reflexes, and autonomic function below the level of injury.

D) Complete SCIs involve a total loss of all sensory and motor function below the level of the injury. Depending on its location, a complete SCI could result in either tetraplegia or paraplegia.

MNL LO: Demonstrate understanding of the concept of mobility in the care of a patient with spinal cord injury.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e (Pearson)
Module 14 Nutrition

The Concept of Nutrition

1) During a health assessment, a client states, "I only eat carbohydrates and low-fat foods. I don't understand why I am still gaining weight!" Which principles of nutrition should guide the nurse's response? **Select all that apply.**
A) Carbohydrates should only be eaten at breakfast.
B) Eating too many carbohydrates leads to excess glucose, which is converted to fat.
C) Excess carbohydrates can lead to obesity.
D) A carbohydrate-limited diet is the only way to not gain weight.
E) Carbohydrates should be high in fiber and low in sugar.
Answer: B, C, E
Explanation: A) Carbohydrates should be eaten throughout the day.
B) Carbohydrates are converted to glucose; when carbohydrates are consumed in excess, the excess glucose is converted to glycogen, or fat.
C) Carbohydrates are stored in adipose tissue, which can lead to weight gain and an increased risk for obesity.
D) A carbohydrate-limited diet is not the only way to avoid weight gain.
E) Carbohydrates should come from the consumption of foods high in fiber and low in added sugars.
Page Ref: 1030
Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 14.1. Analyze the physiology of nutrition in the body.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

2) The nurse is preparing educational materials for a client with heart failure. Which elements should the nurse include when preparing this material? **Select all that apply.**
A) Advising the client to avoid all sodium in the diet
B) Explaining the effects of sodium on heart function
C) Teaching the client how to read nutritional labels
D) Helping the client to recognize foods that are low in sodium
E) Showing the client how to follow the DASH eating plan
Answer: B, C, D, E
Explanation: A) Sodium is important in the diet, and not all sodium should be avoided.
B) In some people, an increase in sodium intake leads to fluid retention and exacerbates heart failure.
C) The nurse should prepare to teach the client how to read nutritional labels.
D) The nurse should prepare to teach the client how to identify foods that are low in sodium.
E) The nurse should prepare to teach the client about the DASH eating plan.
Page Ref: 1048
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 14.3. Outline the relationship between nutrition and other concepts.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

3) The nurse is performing a nutritional assessment of a client who weighs 185 lbs. and is 5 feet, 3 inches tall. This client's body mass index, rounded to the nearest hundredth, is ________.
Answer: 32.77 BMI
Explanation: The nurse should use the formula [Weight in Pounds/(Height in inches × Height in inches)] × 703 for this calculation. The BMI is calculated by dividing weight in pounds (lb) by height in inches (in) squared and multiplying by a conversion factor of 703. The calculation would be
185 / 63 × 63 = 185 / 3969 = 0.0466112 × 703 = 32.77.
Page Ref: 1042
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 14.3. Differentiate among alterations in nutrition.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

4) The nurse is assessing the nutritional status of an older client. Which finding is most likely to suggest xerostomia?
A) The client refuses food because it is difficult to chew with missing teeth.
B) The client frequently becomes dehydrated due to failure to remember to drink water.
C) The client has a chronically dry mouth despite adequate intake of fluids.
D) The client does not enjoy foods due to diminished taste.
Answer: C
Explanation: A) Xerostomia does not affect chewing of food with missing teeth.
B) Xerostomia is not associated with dehydration although a fluid volume deficit can cause dry mucus membranes.
C) Xerostomia is decreased salivation due to decreased function of salivary glands. The client with a dry mouth most clearly demonstrates xerostomia.
D) A change in the taste of food is unrelated to xerostomia.
Page Ref: 1052
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Assessment
Learning Outcome: 14.9. Differentiate considerations related to the care of patients with alterations in nutrition throughout the lifespan.

MNL LO: Analyze the concept of nutrition and its application to nursing care.

5) The nurse is assessing a client who has recently had several blood tests done. Which laboratory results should the nurse identify as indicators of malnutrition? **Select all that apply.**
A) PAB 30 mg/dL
B) PAB 100 mg/L
C) Cholesterol 120 mg/dL
D) Cholesterol 180 mg/dL
E) PAB 12 mg/dL
Answer: B, C, E
Explanation: A) A normal prealbumin (PAB) level is 15-36 mg/dL or 150-360 mg/L. A 30 mg/dL PAB level would not be a cause for concern.
B) A normal prealbumin (PAB) level for adult men and women is 15-36 mg/dL or 150-360 mg/L. A 100 mg/L PAB level would be a cause for concern.
C) A normal cholesterol range is between 160 and 200 mg/ dL. A 120 mg/dL cholesterol level would be a possible indicator of malnutrition.
D) A normal cholesterol range is between 160 and 200 mg/ dL. A 180 mg/dL level would not be cause for concern.
E) A normal prealbumin (PAB) level for adult men and women is 15-36 mg/dL or 150-360 mg/L. A 12 mg/dL PAB level would be a cause for concern.

Learning Outcome: 14.6. Differentiate among common assessment procedures and tests used to evaluate nutritional status.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

WwW.TeSt.Ng

6) The public health nurse is providing community education aimed at promoting nutritional habits that decrease an individual's modifiable risk factors for diseases. Which topics should the nurse include in this teaching session? **Select all that apply.**

A) Benefits of consuming fruits and vegetables

B) Importance of eliminating all fats

C) Selecting lean protein sources

D) Preparing balanced meals

E) Strategies for maintaining recommended daily caloric intake

Answer: A, C, D, E

Explanation: A) Learning about the benefits of consuming fruits and vegetables is a strategy to decrease the risk for disease.

B) Eliminating all fats should not be included, because some fats are considered "healthy" and need to be included in a healthy diet.

C) Learning how to select lean protein sources is a strategy to decrease the risk for disease.

D) Learning how to prepare balanced meals is a strategy to decrease the risk for disease.

E) Learning how to maintain the recommended daily caloric intake is a strategy to decrease the risk for disease.

Learning Outcome: 14.5. Explain the promotion of healthy nutrition.

MNL LO: Analyze the concept of nutrition and its application to nursing care.

7) During a home visit, the nurse is assessing an older adult client. Which assessment findings indicate to the nurse that the client has insufficient nutritional intake? **Select all that apply.**
A) Client reports a problem with dentures slipping while chewing.
B) Client complains of occasional dry mouth and problems with feelings of nausea.
C) Client's adult children arrive to eat dinner together several times a week.
D) Client is prescribed 15 medications.
E) Client's Social Security payments have gone down over the last year.
Answer: A, B, D, E
Explanation: A) The improperly fitting dentures are causing a problem with chewing, which could lead to decreased protein and fruit and vegetable intake.
B) Some medications can cause a dry mouth and nausea.
C) The client's adult children visiting and sharing a meal with the client would likely improve or support the older client's nutritional status.
D) Polypharmacy could negatively influence taste and suppress appetite.
E) Low finances could lead to decreased access to food.
Page Ref: 1052

Learning Outcome: 14.9. Differentiate considerations related to the care of patients with alterations in nutrition throughout the lifespan.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

8) The community health nurse reviews data collected during interviews with community members during a health fair for a brochure on improving iron intake. Which information should the nurse include to help vegans and vegetarians increase iron intake? **Select all that apply.**
A) Take calcium supplements.
B) Consume tofu.
C) Consume lentils.
D) Increase intake of vitamin C.
E) Consume Swiss chard.
Answer: B, C, D, E
Explanation: A) Although calcium supplements are good for vegetarians and vegans to take to ensure adequate calcium intake, they do not specifically provide iron.
B) Tofu is a food that both vegans and vegetarians might eat that can provide needed iron.
C) Lentils is a food that both vegans and vegetarians might eat that can provide needed iron.
D) All vegetarians should ensure that they get adequate amounts of iron, and to facilitate the absorption, vitamin C should also be plentiful in the diet.
E) Swiss chard is a food that both vegans and vegetarians might eat that can provide needed iron.

9) The nurse is asked to explain bariatric surgery. Which category of clients should the nurse explain that are eligible for this procedure?
A) Overweight
B) Pregnant women
C) Adolescents
D) Morbidly obese
Answer: D
Explanation: A) Bariatric surgery would not be considered for clients who are only overweight.
B) Bariatric surgery would not be considered for clients who are pregnant.
C) Bariatric surgery may be considered in adolescents in severe cases of obesity resistant to previous weight loss attempts, but not simply adolescents as a group regardless of their obesity.
D) For people with morbid obesity, bariatric or lap band surgery is an option.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 14.8. Summarize collaborative therapies used by interprofessional teams for patients with alterations in nutrition.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

10) The nurse is reviewing the role of vitamins in maintaining health. Which statement best characterizes vitamin use?
A) Vitamins except for D and K must be consumed through dietary intake.
B) Excess vitamin C can cause nausea, vomiting, weakness, and kidney failure.
C) Generally, two multivitamin pills a day is recommended for all clients regardless of diet.
D) Fat-soluble vitamins in general present the least risk of toxicity to clients who take them in excess.
Answer: A
Explanation: A) With the exception of vitamins D and K, they must be consumed as a part of dietary intake. Vitamin D is manufactured by ultraviolet irradiation of cholesterol molecules in the skin, and vitamin K is synthesized by bacteria in the intestine.
B) Excess vitamin D can cause nausea, vomiting, weakness, and kidney failure.
C) Two multivitamin pills a day is probably excessive because one such vitamin typically contains the recommended intakes of most vitamins and minerals needed on a daily basis and determinations of vitamin intake should always consider diet.
D) Excess consumption of some vitamins, especially the fat-soluble vitamins, can lead to significant toxicity.
Page Ref: 1031, 1038
Cognitive Level: Understanding
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 1.2 Apply theory and research-based knowledge from nursing, the arts, humanities, and other sciences. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 14.8. Summarize collaborative therapies used by interprofessional teams for patients with alterations in nutrition.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

Exemplar 14.A Obesity

1) An adolescent of normal weight reports periods of overeating, especially when parents fight. Which factor increases this client's risk for obesity?
A) Cultural and environmental factors
B) Heredity
C) Low socioeconomic status
D) Physical inactivity
Answer: A
Explanation: A) This client most often overeats because of stress, which is an environmental risk factor for obesity. The client's stress comes from the environment, such as problems at school or at home.
B) The client's overeating is not caused by genetics because the client is of normal weight. Specific genes are associated with obesity of which the client is not demonstrating or experiencing.
C) The client's stress does not come from low socioeconomic status.
D) The client's stress does not come from physical inactivity.
Page Ref: 1056
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Compare the risk factors and prevention of obesity.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

2) A female client has a BMI of 33.2 and waist circumference 90 cm. In which way should the nurse classify this client's obesity?
A) Overweight
B) Obese Class 1
C) Obese Class 2
D) Obese Class 3
Answer: B
Explanation: A) A BMI between 25.0 to 29.9 is considered overweight.
B) A BMI of 33.2 would be in the range for Class I obesity (30.0-34.9). The waist circumference of 90 cm for a woman increases the risk for disease.
C) A BMI between 35.0 and 39.9 is classified as Obesity Class 2.
D) A BMI over 40.0 is classified as Obesity Class 3.
Page Ref: 1057
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Identify the clinical manifestations of obesity.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

3) The nurse is planning a teaching seminar for a group of young adult clients who are at risk for obesity. Which statement by the nurse best addresses their needs?
A) There are drugs that are good to use to reduce weight.
B) Obesity often leads to low self-esteem and depression.
C) Proper diet and exercise programs can not only prevent obesity but also potentially improve the ability to think and the positivity of self-perception.
D) Maternal obesity often leads to menstrual irregularities and higher incidences of infertility.
Answer: C
Explanation: A) Drugs are used to manage obesity, not prevent it.
B) Although obesity is a risk factor for low self-esteem and depression, emphasizing these negative effects does not empower clients to address their risk factors.
C) The young adults who are at risk for obesity need education about changing lifestyles and the importance of preventing obesity as opposed to treating it. Education should include tips on eating healthy and exercising, which can lead to other benefits besides preventing obesity.
D) Information about maternal obesity is not necessarily relevant to all individuals and does not address health promotion.
Page Ref: 1059
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Differentiate care of patients with obesity across the lifespan.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

4) The nurse is caring for a morbidly obese client who is seeking help to lose weight at a bariatric clinic. When planning this client's care, which problem is the priority?

A) Inability to tolerate activity
B) Imbalanced oral intake
C) Issues with coping
D) Changes in body processes

Answer: A

Explanation: A) Along with diet, exercise is an important part of a weight loss program. A client with morbid obesity has a sedentary lifestyle and will have activity intolerance.

B) An imbalance in oral intake might be a contributing factor to the obesity; however, this is not the priority problem.

C) There is no evidence that the client has a problem with coping.

D) There is no evidence that the client has changes in body processes.

Page Ref: 1062

Cognitive Level: Analyzing

Client Need/Sub: Health Promotion and Maintenance

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Apply the nursing process for providing culturally competent care to an individual with obesity.

MNL LO: Analyze the concept of nutrition and its application to nursing care.

5) The nurse is caring for an adult client with a BMI of 26.8 who complains of sleep apnea and gout. Which therapies will the nurse anticipate for this client? **Select all that apply.**

A) Pharmacotherapy

B) Diet

C) Exercise

D) Behavior modification

E) Surgery

Answer: B, C, D

Explanation: A) Pharmacotherapy is not indicated for the client with this BMI.

B) Clients with a BMI of 25-26.9 with two or more comorbidities–sleep apnea and gout in this case–would be treated with diet.

C) Clients with a BMI of 25-26.9 with two or more comorbidities–sleep apnea and gout in this case–would be treated with exercise.

D) Clients with a BMI of 25-26.9 with two or more comorbidities–sleep apnea and gout in this case–would be treated with behavior modification.

E) Surgery is not indicated for a client with this BMI.

Page Ref: 1058

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with obesity.

MNL LO: Analyze the concept of nutrition and its application to nursing care.

6) The nurse is teaching a client scheduled for Roux-en-Y gastric bypass surgery about potential postsurgical complications and how to reduce them. Which client statement best indicates that teaching has been effective?
A) "I need to eat at least one meal a day that is high in simple carbohydrates."
B) "Complications of this surgery are likely to be limited to mild gastrointestinal issues for several days."
C) "I need to be alert for the indications of vitamin deficiencies."
D) "I will not continue my exercise program following this surgery."
Answer: C
Explanation: A) Eating meals high in simple carbohydrates can bring on dumping syndrome, a complication in which stomach contents move rapidly through the small intestine, drawing fluid into the intestine by osmosis.
B) Mild GI issues are not the only significant complication of this surgery.
C) Because these procedures allow food to bypass the duodenum and jejunum, nutrient deficiencies, particularly of iron, calcium, vitamin B_{12}, and, possibly, the fat-soluble vitamins, are common.
D) The client likely should continue the exercise program.
Page Ref: 1060
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Compare the risk factors and prevention of obesity.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

7) The nurse is providing teaching to a female client about dietary modifications to promote weight loss. Which statement by the nurse is accurate?
A) "You will need to follow a lower calorie diet until you lose the weight you want.”
B) "Intermittent fasting is the best approach to follow.”
C) "All fats should be eliminated from the diet.”
D) "We need to decide the best diet approach to meet your weight loss goals.”
Answer: D
Explanation: A) Sustaining weight loss requires individuals to incorporate new patterns in their lives and this requires education and support.
B) Intermittent fasting is not a recommended eating approach to lose weight.
C) No single food group should be eliminated from the diet.
D) For food intake, diets that decrease calorie intake in general, such as a low-calorie, very-low-calorie, meal-replacement, low-carbohydrate, high-protein, ketogenic, or Mediterranean diet can be implemented.
Page Ref: 1060
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with obesity.

MNL LO: Analyze the concept of nutrition and its application to nursing care.

8) The nurse is caring for a school-age client who wants to lose weight. Which suggestion by the nurse might assist the client in being compliant with the weight loss plan in a way that is sensitive to the client's age?
A) "It can be difficult to avoid unhealthy foods if that's what your friends are eating but try to choose healthier options when you can."
B) "Write down the exact foods you eat so that you can see what and how much you are eating."
C) "Watch the nutrient content and number of calories in everything you eat."
D) "Eat at the kitchen table so that you eat along with the rest of the family."
Answer: A
Explanation: A) Nurses in the community, especially in local school systems, are well placed to provide education to children and their families about appropriate food choices and the factors that lead to childhood obesity.
B) Keeping food diaries and monitoring the nutrient content and caloric values of food intake are helpful behavior modification strategies, but these don't take into account the age of the client.
C) Studies on food consumption show that caloric information or nutrient content is not a major consideration in choice among clients.
D) Parental food choices can have a strong impact on children, but some children rebel against these food choices, positively or negatively, and eating with the rest of the family is only beneficial if the family's habits are healthy.
Page Ref: 1061
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Differentiate considerations for care of patients with obesity across the lifespan.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

9) The nurse is planning care for a client with morbid obesity. Which action will the nurse take to support this client's weight loss?
A) Help identify strategies for stress eating
B) Discuss self-monitoring with calorie counts
C) Plan a program of regular increasing activity
D) Establish weight loss goals of 1 to 2 lbs./week
Answer: A
Explanation: A) To promote weight loss, the client should identify strategies for stress eating.
B) Self-monitoring with calorie counts supports education to promote good health maintenance.
C) A program of regular increasing activity supports the problem of encouraging exercise.
D) Establishing a weight loss goal of 1 to 2 lbs./week supports education to promote good health maintenance.
Page Ref: 1063
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with obesity.

MNL LO: Analyze the concept of nutrition and its application to nursing care.

10) The nurse is creating a teaching tool about weight loss and obesity. Which statements regarding upper body obesity should be included? **Select all that apply.**
A) Upper body obesity is also called peripheral obesity.
B) Upper body obesity is the condition in which the waist-to-hip ratio in men is greater than 0.8 or greater than 1 in women.
C) Upper body obesity is associated with a greater risk of cardiovascular mortality.
D) Normal-weight obesity is not harmful to health.
E) Women with upper body obesity are at risk for gestational diabetes.
Answer: C, E
Explanation: A) Upper body obesity is also called central obesity.
B) Upper body obesity is defined as having waist circumference measurements greater than 102 cm (40 in.) for males and 89 cm (35 in.) for females.
C) Researchers found individuals with central obesity when compared to normal-weight individuals to be at greater risk for cardiovascular mortality.
D) Another aspect of central obesity is normal-weight obesity in which individuals are centrally obese but have a normal BMI. The weight-to-height ratio is greater than normal, and reduction of this ratio is the goal rather than weight loss alone.
E) Researchers found individuals with central obesity when compared to normal-weight individuals to be at greater risk for general and gestational diabetes.
Page Ref: 1057
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Identify the clinical manifestations of obesity.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

11) The nurse is asked to explain basal metabolic rate. Which information will the nurse include in response?
A) The amount of energy stored in fat each day
B) The speed of triglyceride breakdown
C) The cost in kilocalories of being alive
D) The speed at which glucose is converted to energy
Answer: C
Explanation: A) BMR is not the amount of energy stored in fat each day.
B) BMR is not the speed of triglyceride breakdown.
C) BMR is the "cost" (in kilocalories) of being alive.
D) BMR is not the speed at which glucose is converted to energy.

Learning Outcome: 14.A. Analyze obesity as it relates to nutrition. Describe the pathophysiology of obesity.
MNL LO: Analyze the concept of nutrition and its application to nursing care.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e **(Pearson)**

Module 15 Oxygenation

The Concept of Oxygenation

1) The nurse recognizes that which pathophysiologic changes are occurring when caring for the client with respiratory acidosis? **Select all that apply.**
A) Increased CO_2
B) Vasoconstriction
C) Decreased O_2
D) Decreased intracranial pressure (ICP)
E) Increased pulse rate
Answer: A, C, E
Explanation: A) Respiratory acidosis is an alteration of acid-base imbalance that results in an excess of dissolved carbon dioxide (increased CO_2).
B) Vasodilatation, not vasoconstriction, occurs as a low pH results in relaxation of vascular smooth muscle by interrupting the normal function of calcium channels.
C) Respiratory acidosis is an alteration of acid-base imbalance that is caused by decreased oxygen intake.
D) Cerebral vasodilation results in increased intracranial pressure.
E) The pulse rate increases in an attempt to compensate for oxygen deprivation.
Page Ref: 1075
Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.3. Outline the relationship between oxygenation and other concepts.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

2) The nurse is providing care to a client diagnosed with chronic obstructive pulmonary disease (COPD). Which clinical manifestations are the direct result of altered perfusion? **Select all that apply.**

A) Bounding pulse
B) Pink nail beds
C) Cyanosis
D) Confusion
E) Wheezing

Answer: C, D

Explanation: A) A weak pulse indicates poor perfusion.
B) Blue nail beds indicate poor perfusion.
C) Clinical manifestations associated with a decrease in perfusion include cyanosis.
D) Clinical manifestations associated with a decrease in perfusion include confusion.
E) Wheezing is an abnormal breath sound that is the result of excess mucus in the airways.

Page Ref: 1073
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.3. Outline the relationship between oxygenation and other concepts.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

3) The nurse is providing care to an adult client with a long history of chronic obstructive pulmonary disease (COPD). The client is admitted to the intensive care unit with a pneumothorax. Which interventions are appropriate for this client? **Select all that apply.**
A) Elevate head of the bed
B) Administer a high rate of oxygen by nasal cannula
C) Prepare for a chest tube insertion
D) Administer prescribed antihypertensive medications
E) Administer intravenous caffeine per order
Answer: A, C
Explanation: A) The nurse providing care to a client with COPD and a pneumothorax would elevate the head of the bed because of the client's dyspnea and orthopnea.
B) Because clients with COPD have a decreased response to hypercarbia, which stimulates breathing, a high rate of oxygen by nasal cannula is inappropriate.
C) The nurse providing care to a client with COPD and a pneumothorax would prepare for a chest tube insertion.
D) There is no indication that the client is experiencing hypertension.
E) IV caffeine is administered to premature infants as a respiratory stimulant. This intervention is not appropriate for an adult client diagnosed with COPD and a pneumothorax.
Page Ref: 1074

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.2. Differentiate among alterations in oxygenation.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

WwW.TeSM.Ws

4) When auscultating the lungs of a client experiencing dyspnea, the nurse hears a low-pitched sound that is continuous throughout inspiration. Which condition caused this lung sound?
A) Narrow bronchi
B) Narrow trachea passages
C) Blocked large airway passages
D) Inflamed pleural surfaces
Answer: C
Explanation: A) Wheezing is created by narrow bronchi.
B) Stridor is the sound created by narrow tracheal passages.
C) Rhonchi suggests blockage of large airway passages, which may be cleared with coughing.
D) A low-pitched grating sound is created by inflamed pleural surfaces.
Page Ref: 1078
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.5. Differentiate among common assessment procedures and tests used to examine oxygenation.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

5) The nurse is reviewing the results of laboratory tests conducted on a client admitted with an alteration in respiratory function. Which laboratory finding would be most significant for this client?
A) Hemoglobin level 14 g/dL
B) Oxygen saturation 96%
C) Serum sodium 140 mg/dL
D) Blood pH 7.32
Answer: D
Explanation: A) The hemoglobin level affects the amount of oxygen that can be carried in the blood; however, the value is within normal limits.
B) Oxygen saturation of 96% is within normal limits.
C) The serum sodium does not impact the oxygen capacity of the body.
D) Normal blood pH is 7.35-7.45. A decreased pH indicates that the client is experiencing acidosis, which indicates an alteration in oxygenation.
Page Ref: 1081
Cognitive Level: Analyzing

Learning Outcome: 15.5. Differentiate among common assessment procedures and tests used to examine oxygenation.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

6) A client with chronic obstructive pulmonary disease (COPD) is prescribed oxygen 24% 2 L/min. Which is the best method to administer oxygen to this client?
A) Face mask
B) Nasal cannula
C) Nonrebreather mask
D) Venturi mask
Answer: B
Explanation: A) A face mask is suited for higher percentages of oxygen and higher flow rates.
B) The oxygen delivery device that would safely administer 24% oxygen at the flow rate of 2 liters per minute is through nasal cannula.
C) A nonrebreather mask is suited for higher percentages of oxygen and higher flow rates.
D) A Venturi mask is suited for higher percentages of oxygen and higher flow rates.

Learning Outcome: 15.7. Summarize collaborative therapies used by interprofessional teams for patients with alterations in oxygenation.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

7) The nurse is planning care for a client experiencing dyspnea and a subsequent activity intolerance. Which action by the nurse is the most appropriate?
A) Encourage strenuous activity.
B) Consult a dietitian for low-calorie meals.
C) Space periods of activity with periods of rest.
D) Encourage dependence with activities of daily living.
Answer: C
Explanation: A) The client will be weak, so the nurse should not encourage strenuous activity.
B) Clients with respiratory disorders often need an increase, not a decrease, in calories to maintain body functions.
C) The client with shortness of breath will experience activity intolerance due to a lack of oxygen and fatigue. It will often be appropriate to space periods of activity with periods of rest.
D) The nurse would want the client to be as independent as possible and would not encourage dependence with activities of daily living.
Page Ref: 1084
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Learning Outcome: 15.6. Analyze independent interventions nurses can implement for patients with alterations in oxygenation.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

8) The nurse is providing care for a client admitted during an acute exacerbation of asthma. Which medication does the nurse anticipate to relieve the acute symptoms exhibited by the client?
A) Inhaled short-acting beta-agonists
B) Oral corticosteroids
C) Inhaled long-acting beta-agonists
D) Oral anticholinergics
Answer: A
Explanation: A) The client admitted with an acute exacerbation of asthma will require a rescue medication, such as an inhaled short-acting beta-agonist.
B) Oral corticosteroids are maintenance medications used to treat asthma.
C) Inhaled long-acting beta agonists are maintenance medications used to treat asthma.
D) Oral anticholinergics are maintenance medications used to treat asthma.
Page Ref: 1086

Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning
Learning Outcome: 15.7. Summarize collaborative therapies used by interprofessional teams for patients with alterations in oxygenation.

MNL LO: Analyze the concept of oxygenation and its application to nursing care.

9) The nurse assigned to the newborn nursery is conducting shift assessments. While assessing one newborn, the nurse notes the respiratory rate is 52 breaths per minute. Which action by the nurse is appropriate?

A) Notify the healthcare provider of this assessment finding.
B) Obtain an arterial blood gas for further respiratory assessment.
C) Begin monitoring the respiratory rate every 5 minutes.
D) Continue to monitor the newborn per facility policy.

Answer: D

Explanation: A) The healthcare provider does not need to be notified.
B) An arterial blood gas is not needed.
C) There is no need to monitor the respiratory rate every 5 minutes.
D) A respiratory rate of 52 breaths per minute is a normal finding in a newborn. Respiratory rates are highest and most variable in newborns. The respiratory rate of a neonate or newborn is 30-80 breaths per minute. Therefore, this client only needs monitoring.

Page Ref: 1071

Learning Outcome: 15.8. Differentiate considerations related to the care of patients with alterations in oxygenation throughout the lifespan.

MNL LO: Analyze the concept of oxygenation and its application to nursing care.

10) The nurse is conducting an assessment for a client on a medical-surgical unit. Which findings are indicative of a client who is experiencing tachypnea? **Select all that apply.**
A) Excessive rapid breathing
B) Chest pain
C) Rapid breathing at rest
D) Shallow breathing
E) Cyanosis
Answer: A, C, D
Explanation: A) Excessive rapid breathing is a manifestation of tachypnea.
B) Chest pain is a manifestation of a pneumothorax.
C) Rapid breathing at rest is a manifestation of tachypnea.
D) Shallow breathing is a manifestation of tachypnea.
E) Cyanosis is a late manifestation of hypoxemia.

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.2. Differentiate among alterations in oxygenation.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

11) The charge nurse is observing a newly licensed nurse conduct an admission assessment on a client with asthma. Which action by the newly licensed nurse requires immediate intervention?
A) The newly licensed nurse is observed obtaining the pulse oximetry reading 10 minutes after the client used an albuterol inhaler.
B) The newly licensed nurse is observed continuing to ask the client questions regarding history while the client demonstrates difficulty breathing and signs of respiratory impairment.
C) The newly licensed nurse is observed assessing the client's thoracic wall, skin, and nail beds.
D) The newly licensed nurse is observed auscultating breath sounds with a stethoscope.
Answer: B
Explanation: A) Although the pulse oximetry reading may not be a true indicator of the level of respiratory distress of the client because of the use of an albuterol inhaler within 30-60 minutes of this assessment, it is still an appropriate action for the newly licensed nurse to take and does not require the charge nurse to intervene immediately.
B) The charge nurse should intervene immediately if the nurse observes the client is demonstrating impairment at or near respiratory failure; the client will not be able to respond to questions. Assessment questions should be tailored and asked of any family member or friend accompanying the client.
C) Assessing the client's thoracic wall, skin, and nail beds is an appropriate action at this time.
D) Auscultating the client's breath sounds with the use of a stethoscope is appropriate.
Page Ref: 1075
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 15.5. Differentiate among common assessment procedures and tests used to examine oxygenation.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

12) Which independent nursing interventions are appropriate for a client who is experiencing an alteration in oxygenation? **Select all that apply.**
A) Encouraging deep breathing exercises
B) Assisting with positioning
C) Providing suctioning
D) Prescribing bronchodilators
E) Monitoring activity intolerance
Answer: A, B, C, E
Explanation: A) Examples of independent interventions that nurses can provide to clients with alterations in oxygenation include deep breathing exercises.
B) Examples of independent interventions that nurses can provide to clients with alterations in oxygenation include assisting with positioning.
C) Examples of independent interventions that nurses can provide to clients with alterations in oxygenation include suctioning.
D) It is outside the scope of nursing practice to prescribe a bronchodilator to a client. The nurse, however, can administer a prescribed bronchodilator. This is considered a collaborative nursing intervention.
E) Examples of independent interventions that nurses can provide to clients with alterations in oxygenation include monitoring activity intolerance.

Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.6. Analyze independent interventions nurses can implement for patients with alterations in oxygenation.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

WwW.TeSM.Ws

13) While performing nasotracheal suctioning, the nurse notes the older adult client with an alteration in oxygenation is moving the head around and pulling at the nurse's hand to remove the suction catheter. Which actions by the nurse are appropriate? **Select all that apply.**
A) Remove the suction catheter
B) Lower the head of the bed
C) Decrease the suction pressure
D) Apply restraints to the client's arms and legs
E) Hyperoxygenate the client
Answer: A, C, E
Explanation: A) The older adult client is demonstrating signs of hypoxemia. The nurse should remove the suction catheter.
B) The older client is demonstrating signs of hypoxemia. The client should be in the Fowler or high-Fowler position.
C) The older client is demonstrating signs of hypoxemia. The nurse should decrease the suction pressure.
D) Restraining the patient does not address the hypoxemia.
E) The older client is demonstrating signs of hypoxemia. The nurse should hyperoxygenate the client.
Page Ref: 1092-1093

Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 15.8. Differentiate considerations related to the care of patients with alterations in oxygenation throughout the lifespan.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

14) Which structure in the respiratory system is the site of gas exchange?
A) Macrophage
B) Bronchi
C) Alveoli
D) Bronchiole
Answer: C
Explanation: A) Macrophages are immune cells that keep the alveoli region free of microbes.
B) The bronchi are larger structures in the respiratory system that serve as tracts for airflow.
C) The alveoli comprise the terminal structures of the lower respiratory system. Alveoli serve as the sites of gas exchange, specifically, carbon dioxide and oxygen.
D) Bronchioles are larger structures in the respiratory system that serve as tracts for airflow.

Learning Outcome: 15.1. Analyze the physiology of oxygenation in the body.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

15) In which way do vaccinations promote healthy oxygenation?
A) Reduce the transmission of preventable diseases
B) Increase the exchange of oxygen for carbon dioxide in the lungs
C) Promote adequate blood circulation to organs and tissues
D) Prevent all respiratory infections
Answer: A
Explanation: A) Vaccinations help decrease the transmission of preventable diseases, many of which are spread by respiratory secretions. Many of these diseases also affect the respiratory system and can alter oxygenation.
B) Vaccinations do not directly increase the exchange of oxygen for carbon dioxide in the lungs.
C) Vaccinations do not promote adequate blood circulation.
D) Vaccinations can prevent some respiratory infections, but not all respiratory infections, and they can also prevent some non-respiratory infections.

Learning Outcome: 15.4. Explain the promotion of healthy oxygenation.
MNL LO: Analyze the concept of oxygenation and its application to nursing care.

Exemplar 15.A Acute Respiratory Distress Syndrome

1) Which clinical manifestation does the nurse correctly attribute to hypoxia in a client with acute respiratory distress syndrome (ARDS)?
A) Fluid imbalance
B) Hypertension
C) Bradycardia
D) Dyspnea
Answer: D
Explanation: A) Fluid and electrolyte imbalances occur due to the nutritional imbalances associated with ARDS.
B) Dyspnea does not cause hypertension in the client with hypoxia secondary to ARDS. Fluid and electrolyte imbalances occur due to the nutritional imbalances associated with ARDS. The nurse would expect tachycardia, not bradycardia, as a result of hypoxia.
C) The nurse would expect tachycardia, not bradycardia, as a result of hypoxia.
D) Dyspnea is a clinical manifestation of clients experiencing hypoxia secondary to ARDS.
Page Ref: 1095
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Identify the clinical manifestations of ARDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

2) The nurse is providing care to a client admitted to the emergency department with the diagnosis of acute respiratory distress syndrome (ARDS). When educating the client's family, in which order should the nurse instruct as the expected progression of the disease process?
A) Initiation of ARDS
B) Onset of pulmonary edema
C) End-stage ARDS
D) Alveolar collapse
Answer: A, B, D, C
Explanation: ARDS begins with inflammatory cellular responses and biochemical mediators that damage the alveolar-capillary membrane. Increased interstitial pressure and damage to the alveolar membrane allow fluid to enter the alveoli. The inflammatory process damages surfactant-producing cells, leading to a deficit of surfactant, increased alveolar surface tension, and alveolar collapse. Multiple-organ system dysfunction of the kidneys, liver, gastrointestinal tract, central nervous system, and cardiovascular system are the leading causes of death in ARDS.

Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Describe the pathophysiology of ARDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

WwW.TeSM.WS

3) The nurse is providing care to a client with sepsis due to a severely infected leg wound. The client states that he is having trouble breathing. Upon assessment, the nurse notes dyspnea, a respiratory rate of 32, the use of accessory muscles to breathe, and rales and rhonchi upon auscultation of the lungs. The nurse recognizes these findings as characteristic of which condition?
A) Allergic response from antibiotic therapy
B) Deep vein thrombosis
C) Acute respiratory distress syndrome
D) Anemia
Answer: C
Explanation: A) An allergic response from antibiotic therapy may or may not be associated with a systemic infection from an infected leg wound and is not associated with the development of ARDS.
B) Deep vein thrombosis may or may not be associated with a systemic infection from an infected leg wound and is not associated with the development of ARDS.
C) Sepsis is one of the most common causes of acute respiratory distress syndrome (ARDS). The client has a systemic infection, which is sepsis, and is complaining that it is getting hard to breathe. Pulmonary assessment data indicate that the client is developing acute respiratory distress.
D) Anemia may or may not be associated with a systemic infection from an infected leg wound and is not associated with the development of ARDS.
Page Ref: 1094
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Identify the clinical manifestations of ARDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

4) A client with a respiratory rate of 8 breaths per minute has an oxygen saturation of 82%. Which problem is a priority for this client?

A) Risk for infection

B) Inadequate spontaneous ventilation

C) Potential for confusion

D) Decreased cardiac output

Answer: B

Explanation: A) Risk for infection is not a priority problem for this client.

B) A priority problem for a client with a respiratory rate of 8 breaths per minutes and an oxygen saturation of 82% is inadequate spontaneous ventilation. If the current pattern continues without intervention, the client could experience respiratory arrest.

C) The potential for confusion is not a current problem for this client.

D) Decreased cardiac output is not a current problem for this client.

Page Ref: 1103

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with ARDS.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

5) A client with acute respiratory distress syndrome (ARDS) is being weaned from ventilatory support. Which nursing actions are appropriate for this client? **Select all that apply.**
A) Increase percentage of oxygen being provided through the ventilator.
B) Place in the Fowler position.
C) Provide morning care during the weaning procedures.
D) Begin weaning procedures in the morning.
E) Medicate with morphine for pain as needed.
Answer: B, D
Explanation: A) The percentage of oxygen is typically reduced during the weaning process.
B) The client should be in the Fowler or high-Fowler position, as this facilitates lung expansion and reduces the work of breathing.
C) Activities and care should be limited during the weaning process to reduce the demand for oxygen.
D) Weaning a client from ventilatory support should begin in the morning when the client is well-rested.
E) The client should not be given any medication known to suppress respirations, as this would interfere with the weaning process.
Page Ref: 1105
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with ARDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

6) A client receiving treatment for acute respiratory distress syndrome (ARDS) is demonstrating anxiety related to having to stay on the ventilator indefinitely. Which interventions by the nurse are appropriate? **Select all that apply.**

A) Explain about care areas specifically designed for long-term ventilatory support.
B) Dim the lights and reduce distracting noise, such as the television.
C) Instruct that intubation and ventilation are temporary measures.
D) Encourage family visits and participation in care.
E) Remain with the client as much as possible.

Answer: C, D, E

Explanation: A) Explaining that there are care areas designed for long-term ventilatory support could increase the client's anxiety.

B) The nurse should provide distractions such as television or radio and not dim the lights or turn off the television, which could also increase the client's anxiety.

C) The nurse should instruct that intubation and ventilation are temporary measures to allow the lungs to rest and heal.

D) A critical illness creates anxiety for any client. For the client with ARDS, anxiety is compounded by intubation and mechanical ventilation. To reduce this client's anxiety, the nurse should encourage the family to visit and participate in care.

E) A critical illness creates anxiety for any client. For the client with ARDS, anxiety is compounded by intubation and mechanical ventilation. To reduce this client's anxiety, the nurse should remain with the client as much as possible.

Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with ARDS.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

7) Which data supports the nurse's assessment that a newborn with acute respiratory distress syndrome (ARDS) is improving?
A) Increased $PaCO_2$
B) Oxygen saturation of 92%
C) Pulmonary vascular resistance increases
D) Thick secretions from the respiratory tract
Answer: B
Explanation: A) Increased $PaCO_2$ indicates continued distress.
B) An expected outcome for a client being treated for ARDS is maintaining an oxygen saturation of greater than 90%. The newborn diagnosed with ARDS with an oxygen saturation of 92% is improving.
C) Increased pulmonary vascular resistance indicates continued distress.
D) Thick secretions from the respiratory tract indicates continued distress.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

8) The nurse educator prepares to speak to a group of nursing students about direct and indirect insults to the lungs that may lead to the development of acute respiratory distress syndrome (ARDS). Which conditions will the nurse include in the teaching session? **Select all that apply.**
A) Sepsis
B) Viral pneumonia
C) Drug overdose
D) Near drowning in saltwater
E) Fractured humerus
Answer: A, B, C, D
Explanation: A) ARDS is a severe form of acute respiratory failure that occurs in response to pulmonary or systemic insults. Such insults include sepsis.
B) ARDS is a severe form of acute respiratory failure that occurs in response to pulmonary or systemic insults. Such insults include pulmonary infections.
C) ARDS is a severe form of acute respiratory failure that occurs in response to pulmonary or systemic insults. Such insults include drug overdose.
D) ARDS is a severe form of acute respiratory failure that occurs in response to pulmonary or systemic insults. Such insults include saltwater inhalation.
E) A fractured humerus is not a risk factor for the development of ARDS.

WW.TBSM.WS

Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Summarize risk factors for ARDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

9) The nurse is caring for a client admitted with septic shock. Which early clinical manifestation might indicate the development of ARDS?
A) Intercostal retractions
B) Cyanosis
C) Tachypnea
D) Tachycardia
Answer: C
Explanation: A) As the distress progresses, the client would demonstrate intercostal retractions.
B) Cyanosis is a late manifestation.
C) Dyspnea and tachypnea are early clinical manifestations of ARDS.
D) As the distress progresses, the client would demonstrate tachycardia.
Page Ref: 1095
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Identify the clinical manifestations of ARDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

10) A client admitted with smoke inhalation injuries develops signs and symptoms of acute respiratory distress syndrome (ARDS). The nurse anticipates the healthcare provider will prescribe which course of action with regard to oxygenation?
A) Oxygen via a nasal cannula
B) Mechanical ventilation
C) Oxygen via a face mask
D) Oxygen via a Venturi mask
Answer: B
Explanation: A) Oxygen administered via nasal cannula requires active and adequate breathing by the client, which may not be possible for the client with ARDS.
B) With ARDS, it is rarely possible to maintain adequate tissue oxygenation with oxygen therapy alone. Therefore, mechanical ventilation is often necessary.
C) Oxygen administered via face mask requires active and adequate breathing by the client, which may not be possible for the client with ARDS.
D) Oxygen administered via Venturi mask requires active and adequate breathing by the client, which may not be possible for the client with ARDS.

Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with ARDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

WwW.TeSm.Ws

11) The nurse is caring for a client diagnosed with acute respiratory distress syndrome (ARDS). The client is intubated and placed on mechanical ventilation with positive pressure ventilation. Which assessment finding indicates a decrease of cardiac output secondary to positive pressure ventilation?

A) Blood pressure increases from 88/58 mmHg to 90/60 mmHg
B) Urine output decreases from 30 mL/hr to 25 mL/hr
C) Heart rate drops from 108 bpm to 104 bpm
D) Oxygen saturation increases from 82% to 90%

Answer: B

Explanation: A) Although hypotension indicates a decreased cardiac output, the level is improved from the previous assessment, suggesting it is not contributing to decreased cardiac output.

B) Reduced cardiac output results in reduced perfusion of the kidneys, with a resulting decrease in urine output. Expected urine output is at least 30 mL/hr. This client's urine output is decreased; therefore, this finding supports the problem of decreased cardiac output.

C) Although tachycardia is an indication of a decreased cardiac output, the rate has improved from the previous assessment, suggesting that it is not contributing to decreased cardiac output.

D) The oxygen saturation level is within normal limits for this client and improving from the previous assessment.

Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with ARDS.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

12) The nurse is providing care to a client with ARDS who has a tracheostomy. The nurse will monitor the client for complications related to the loss of which protective mechanism?
A) The ability to cough
B) Filtration and humidification of inspired air
C) Decrease in oxygen-carrying capacity of the trachea
D) The sneeze reflex initiated by irritants in the nasal passages
Answer: B
Explanation: A) The client can still cough.
B) When the nasal passages are bypassed, as they would be in the case of a client with a tracheostomy, the filtration, humidification, and warming provided by the nasal passages are also bypassed.
C) There is no decrease in the oxygen-carrying capacity of the trachea.
D) The client can still sneeze.
Page Ref: 1101

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

13) Which client will the nurse identify as likely to have the poorest outcome from ARDS?
A) Hispanic male with pneumonia
B) African American male with sepsis
C) White female with sepsis
D) African American female with chest trauma
Answer: B
Explanation: A) The risk for mortality from ARDS is not greater in Hispanic clients.
B) The risk for mortality from ARDS is greater for men than for women, and it is greater for African Americans than people from other races. In addition, clients who develop ARDS from sepsis have poorer outcomes than clients who develop ARDS from pulmonary infections or trauma. Therefore, the African American male with ARDS from sepsis will likely have the poorest outcome.
C) The risk for mortality from ARDS is not greater in White females.
D) The risk for mortality from ARDS is greater for men than for women.
Page Ref: 1094

Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Describe the etiology of ARDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

14) Which action will the nurse take to prevent the development of ARDS in a hospitalized client?
A) Perform postural drainage for clients with respiratory congestion.
B) Elevate the head of the bed for clients who are ingesting food.
C) Provide smoking cessation literature to clients who smoke.
D) Administer oxygen as ordered by the healthcare provider.
Answer: B
Explanation: A) Performing postural drainage will not prevent ARDS.
B) Aspiration of gastric contents is a major risk factor for developing ARDS. Therefore, simple interventions such as elevating the head of the bed for clients who are ingesting food can help prevent ARDS.
C) Although smoking may increase the risk for ARDS, it is not a direct cause of ARDS, so smoking cessation literature will not prevent ARDS in hospitalized clients.
D) Administering oxygen will not prevent ARDS.
Page Ref: 1095
Cognitive Level: Remembering

Learning Outcome: 15.A. Analyze acute respiratory distress syndrome (ARDS) as it relates to oxygenation. Compare methods for preventing ARDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

15) The nurse is caring for a woman who is 32 weeks pregnant and requires mechanical ventilation for ARDS. In addition to standard nursing interventions for adult clients with ARDS, which special interventions need to be implemented for this client?
A) Inducing labor
B) Administering nitric oxide and corticosteroids
C) Providing nutritional support
D) Fetal monitoring
Answer: D
Explanation: A) Not all pregnant women with ARDS will need immediate emergency delivery of the neonate.
B) Administering nitric oxide and corticosteroids are interventions for all adult clients with ARDS, not only pregnant women.
C) Providing nutritional support is an intervention for all adult clients with ARDS, not only pregnant women.
D) Care for pregnant clients with ARDS who are at least at 20-24 weeks' gestation should include close fetal monitoring for potential emergency delivery. If the ARDS leads to compromised placental oxygen transfer, the neonate should be delivered immediately for the best outcome.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with acute respiratory distress syndrome.

Exemplar 15.B Asthma

1) The nurse is providing care to a client admitted after experiencing an acute asthma attack. Which assessment findings should the nurse identify as signs that the client has progressed to respiratory failure? **Select all that apply.**
A) Retractions and fatigue
B) Tachycardia and tachypnea
C) Inaudible breath sounds
D) Diffuse wheezing and the use of accessory muscles when inhaling
E) Reduced wheezing and an ineffective cough
Answer: C, E
Explanation: A) Retractions and fatigue indicate a progression of the severity of the symptoms and may require nursing intervention, but they do not indicate respiratory failure.
B) During an asthma attack, tachycardia and tachypnea are common. They are early symptoms of the disease process and can be addressed without urgency.
C) Inaudible breath sounds indicate that the client is progressing to respiratory failure, and immediate interventions are necessary.
D) Diffuse wheezing and the use of accessory muscles when inhaling indicate a progression of the severity of the symptoms and may require nursing intervention, but they do not indicate respiratory failure.
E) Reduced wheezing and ineffective cough indicate that the client is progressing to respiratory failure, and immediate interventions are necessary.

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Identify the clinical manifestations of asthma.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

2) Friends of a client hospitalized with asthma would like to bring the client a gift. Which gift should the nurse recommend for this client?
A) A basket of flowers
B) A stuffed animal
C) Fruit and candy
D) A book
Answer: D
Explanation: A) Flowers should be avoided.
B) Items that may contain dust, such as a stuffed animal, should be avoided.
C) Specific foods must be avoided.
D) Objects void of irritants, such as a book, would be an appropriate gift.
Page Ref: 1109
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Compare methods for preventing asthma.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

3) The nurse is teaching environmental control to the parents of a child with asthma. Which statement by the parents indicates effective teaching?
A) "We'll be sure to use the fireplace often to keep the house warm in the winter."
B) "We will replace the carpet in our child's bedroom with tile."
C) "We'll keep the plants in our child's room dusted."
D) "We're glad the dog can continue to sleep in our child's room."
Answer: B
Explanation: A) Smoke from fireplaces should be eliminated.
B) Control of dust in the child's bedroom is an important aspect of environmental control for asthma management, and replacing the carpeting in the child's bedroom with tile flooring will reduce dust.
C) When possible, plants should not be kept in the home.
D) When possible, pets should not be kept in the home.
Page Ref: 1109
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Compare methods for preventing asthma.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

4) A client diagnosed with asthma has a respiratory rate of 28 at rest with audible wheezes upon inspiration. Based on this data, which problem should the nurse make a priority?
A) Impaired airway clearance
B) Impaired tissue perfusion
C) Ineffective breathing pattern
D) Inability to tolerate activity
Answer: C
Explanation: A) Not enough information is provided to determine whether the client has impaired airway clearance.
B) Not enough information is provided to determine whether the client has impaired tissue perfusion.
C) The client is experiencing an increased respiratory rate and is wheezing, which is an ineffective breathing pattern.
D) Not enough information is provided to determine whether the client has activity intolerance.
Page Ref: 1120
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with asthma.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

5) A client asks why asthma medication is needed even though the client's last attack was several months ago. Which response by the nurse is appropriate?
A) "The medication needs to be taken or your lungs will be severely damaged, and we will not be able to prevent an acute attack."
B) "The medication needs to be taken indefinitely according to your doctor, so you should discuss this with him."
C) "The medication is still needed to decrease inflammation in your airways and help prevent an attack."
D) "The medication needs to be taken for at least a year; then, if you have not had an acute attack, you can stop it."
Answer: C
Explanation: A) Telling a client that lungs will be severely damaged is nontherapeutic; the inability to prevent an acute attack in this client is not true.
B) The nurse is able to answer the client's question; it does not need to be referred to the physician.
C) Effective treatment of asthma includes long-term treatment to prevent attacks and decrease inflammation.
D) Long-term treatment of asthma continues indefinitely, not for just 1 year.
Page Ref: 1112
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with asthma.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

6) The nurse is instructing a client who is prescribed ipratropium (Atrovent) for asthma. Which should be included in this client's teaching? **Select all that apply.**
A) Take no more than the prescribed number of doses each day.
B) Rinse the mouth after taking this medication.
C) Take on an empty stomach.
D) Take with meals or a full glass of water.
E) Use hard candy or drink extra fluids to help with a dry mouth.
Answer: A, E
Explanation: A) Appropriate teaching for a client prescribed ipratropium (Atrovent) includes only taking the prescribed number of doses each day to prevent a drug overdose.
B) The mouth does not need to be rinsed after taking this medication as this medication is not a corticosteroid, but an anticholinergic agent.
C) This medication does not need to be taken on an empty stomach.
D) This medication does not need to be taken with meals or a full glass of water.
E) Appropriate teaching for a client prescribed ipratropium (Atrovent) includes using hard candy or extra fluids to decrease dry mouth.

Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with asthma.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

7) The nurse is planning care for a young adolescent client diagnosed with asthma. Which evidence-based, age-appropriate interventions will the nurse include in the plan of care? **Select all that apply.**

A) Referring to a peer-led support group
B) Teaching the parents how to administer maintenance medication prior to teaching the client
C) Assessing peer support when planning care
D) Collaborating with teachers for support in the school setting
E) Telling the client to avoid medication while at school

Answer: A, C, D

Explanation: A) Age-appropriate, evidence-based interventions for a young adolescent client diagnosed with asthma include referral to a peer-led support group.

B) While it is appropriate to include the parents in the educational process, the client should be taught how to administer medications prior to teaching the parents.

C) Age-appropriate, evidence-based interventions for a young adolescent client diagnosed with asthma include assessing peer support of the client.

D) Age-appropriate, evidence-based interventions for a young adolescent client diagnosed with asthma include collaborating with teachers to ensure the client has the necessary support in the school setting.

E) Avoiding medication administration while in school could lead to an acute asthma attack.

Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Differentiate care of patients with asthma across the lifespan.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

8) The nurse instructs a client with asthma on bronchodilator therapy. Which statement indicates client understanding of how the drug works?
A) "The medication widens the airways by causing airway muscle contraction."
B) "The medication widens the airways by causing airway muscle relaxation."
C) "The medication widens the airways by decreasing histamine production."
D) "The medication widens the airways by decreasing mucus production."
Answer: B
Explanation: A) Bronchodilators stimulate bronchiolar smooth muscle relaxation, not contraction.
B) Bronchodilators stimulate bronchiolar smooth muscle relaxation.
C) Bronchodilators do not decrease the production of histamine.
D) Bronchodilators do not decrease the production of mucus.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

9) The nurse working on a pediatric unit is caring for a client newly diagnosed with asthma. Which assessment data indicate impending respiratory failure and the need for immediate intervention? **Select all that apply.**

A) Shallow respirations
B) Slightly diminished breath sounds
C) Decreased wheezing
D) Increased crackles
E) Increased respiratory rate

Answer: A, C

Explanation: A) Respiratory status can change rapidly during an acute asthma attack. Slowed, shallow respirations may indicate exhaustion and impending respiratory failure. Immediate intervention is necessary.

B) Respiratory status can change rapidly during an acute asthma attack. Significantly diminished breath sounds may indicate exhaustion and impending respiratory failure.

C) Respiratory status can change rapidly during an acute asthma attack. Decreased wheezing may indicate exhaustion and impending respiratory failure.

D) Increased crackles are usually associated with heart failure and are not an indication of respiratory failure.

E) An increased respiratory rate indicates respiratory compromise, but not respiratory failure.

WwW.TeSM.Ws

Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Identify the clinical manifestations of asthma.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

10) The nurse is providing care to a client with asthma. When developing the client's plan of care, which intervention would be most appropriate to promote effective gas exchange?
A) Provide adequate rest periods
B) Reduce excessive stimuli
C) Assist with activities of daily living
D) Place in Fowler position
Answer: D
Explanation: A) Providing adequate rest periods prevents fatigue and reduces oxygen demands.
B) Reducing excessive stimuli promotes rest.
C) Assisting with activities of daily living conserves energy and reduces oxygen demands.
D) Placing in Fowler position facilitates breathing and lung expansion, promoting airway clearance.
Page Ref: 1120
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with asthma.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

11) The nurse is reviewing discharge instructions with a client who is newly diagnosed with asthma. Which client statement indicates a need for further teaching?
A) "I need to rinse my mouth after every use of my inhaler."
B) "I need to take my montelukast at least 2 hours before exercising."
C) "When inhaling two different medications, I should use the bronchodilator last."
D) "Because I am on theophylline, I will need to have therapeutic blood levels drawn."
Answer: C
Explanation: A) The mouth should be rinsed after using an inhaler.
B) Montelukast should be taken 2 hours before exercising.
C) When using two different medications taken by inhalation, the bronchodilator should always be used first. This helps open the airways to enhance the effectiveness of the second medication.
D) Theophylline levels are needed to determine if the dosage needs to be adjusted.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

12) Which pathophysiologic stimulus should the nurse explain that initiates asthma?
A) Bronchoconstriction
B) Inflammation in the airways
C) Airway edema
D) Mucus secretion
Answer: B
Explanation: A) Inflammation can lead to bronchoconstriction.
B) In asthma, the airways are in a persistent state of inflammation, and this is the primary stimulus that initiates asthma.
C) Inflammation causes airway edema.
D) Inflammation causes increased mucus secretion.

Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Describe the pathophysiology of asthma.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

13) Which triggers can stimulate an acute asthma attack? **Select all that apply.**
A) Stress
B) Animal dander
C) Loud noises
D) Exercise
E) Bright lights
Answer: A, B, D
Explanation: A) Stress is a known trigger of asthma.
B) Animal dander is a known trigger of asthma.
C) Loud noises may trigger hearing loss or headaches, but they will not trigger asthma.
D) Exercise is a known trigger of asthma.
E) Bright lights are not known to trigger asthma.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

14) The nurse is collecting a health history for a 12-month-old child. The child lives in a home where both parents smoke, and the child has had respiratory syncytial virus twice since birth. The child's older sister was recently diagnosed with asthma. Which is this child's risk of developing asthma later in life?
A) Above average
B) Average
C) Below average
D) Well below average
Answer: A
Explanation: A) Risk factors for asthma include exposure to air pollution, including secondary smoke from cigarettes, and early exposure to respiratory syncytial virus. Genetic factors may also play a role in asthma development. Because of the presence of these risk factors, this child has an above average risk of developing asthma later in life.
B) The child has a greater than average risk for developing asthma later in life.
C) The child's risk for developing asthma is greater than below average.
D) The child's risk for developing asthma is greater than well below average.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

W W . T B S M . W S

15) An older adult client experiencing repeated exacerbations of asthma reports difficulty holding the inhaler and remembering to take medications. Which problem should the nurse make a priority for this client?
A) Insufficient knowledge
B) Inadequate health management skills
C) Anxiety
D) Ineffective breathing pattern
Answer: B
Explanation: A) The client appears to have adequate knowledge about how to cope with the condition.
B) Based on the frequency of exacerbations, problems using the inhaler, and difficulty remembering to take medications, the priority problem for this client would be inadequate health management skills.
C) There is no evidence that the client is experiencing anxiety.
D) There is no evidence that the client is having a problem with the breathing pattern.
Page Ref: 1120
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Management of Care
Standards: QSEN Competencies: I.A.1. Learning Outcome: 15.B. Analyze asthma as it relates to oxygenation. Differentiate care of patients with asthma across the lifespan.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with asthma.

Exemplar 15.C Chronic Obstructive Pulmonary Disease

1) Which assessment finding by the nurse supports the diagnosis that a client is in the early stages of chronic obstructive pulmonary disease (COPD)?
A) Dysrhythmias
B) Cyanotic nail beds
C) Clubbing of the fingers
D) Cough in the morning producing clear sputum
Answer: D
Explanation: A) Enlargement and thickening of the right ventricle of the heart often results in dysrhythmias.
B) With the progression of COPD, the body compensates by producing extra red blood cells. These extra blood cells clog the small blood vessels of the fingers, leading to the development of cyanotic nail beds.
C) With the progression of COPD, the body compensates by producing extra red blood cells. These extra blood cells clog the small blood vessels of the fingers, leading to the development of clubbing of the fingertips.
D) The earliest-presenting symptom of COPD is coughing in the morning with clear sputum unless the client develops an infection, in which case the sputum would become yellow or green in color.
Page Ref: 1125
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Identify the clinical manifestations of COPD.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

2) The nurse is providing care to a client diagnosed with chronic obstructive pulmonary disease (COPD) after years of experiencing emphysema. Which clinical manifestation does the nurse anticipate when assessing this client?

A) Tachycardia

B) Cough

C) Barrel chest

D) Wheezing

Answer: C

Explanation: A) Tachycardia is not specific to COPD caused by emphysema.

B) Coughing is not specific to COPD caused by emphysema.

C) Barrel chest occurs because the lungs are chronically overinflated with air, so the rib cage stays partially expanded.

D) Wheezing is not specific to COPD caused by emphysema.

Page Ref: 1126

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Identify the clinical manifestations of COPD.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

3) The nurse is providing care to a client diagnosed with chronic obstructive pulmonary disease (COPD). Which factors in the client's history support the current diagnosis? **Select all that apply.**

A) Working in an industrial environment
B) Working in an office setting with air conditioning
C) History of asthma
D) Current cigarette smoking
E) Playing golf several times a week

Answer: A, C, D

Explanation: A) Risk factors associated with the development of COPD include working in an industrial environment.
B) Working in an office setting with air conditioning is not a risk factor for the development of COPD.
C) Risk factors associated with the development of COPD include a history of asthma.
D) Risk factors associated with the development of COPD include cigarette smoking.
E) Playing golf several times a week is not a risk factor for the development of COPD.

Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Summarize the risk factors for COPD.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

WwW.TeSt-Wo

4) The nurse is caring for a Spanish-speaking client admitted for exacerbation of chronic obstructive pulmonary disease (COPD). The client speaks very little English and is a smoker. Which action would be the most beneficial for this client?
A) Have the adult child of the client translate during the assessment process
B) Encourage aerobic activity
C) Encourage the client to write down questions prior to seeing the healthcare provider
D) Obtain educational materials about smoking cessation written in Spanish.
Answer: D
Explanation: A) Relatives should not be used as medical interpreters because of the need for knowledge of medical terminology.
B) Encouraging aerobic activity is not an appropriate intervention for a client diagnosed with COPD.
C) Writing down questions might be appropriate for an English-speaking client but will not be appropriate for a Spanish-speaking client being treated in an English-speaking healthcare environment.
D) A Spanish-speaking client who smokes and is diagnosed with COPD requires information regarding smoking cessation. For clients who do not speak English, it is appropriate for the nurse to obtain written education material for the client in the client's native language, Spanish.
Page Ref: 1125
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies:.2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Compare methods of preventing COPD.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

5) The nurse is planning care for the client diagnosed with chronic obstructive pulmonary disease (COPD) who has a breathing rate of 32 per minute, elevated blood pressure, and fatigue. Which problem is the priority for this client?
A) Inadequate family coping skills
B) Impaired airway clearance
C) Anxiety
D) Ineffective breathing pattern

Answer: D

Explanation: A) There is no information to support inadequate family coping skills.
B) There is no information to support impaired airway clearance, as there is no mention that the client is coughing.
C) There is no information to support anxiety.
D) The client's respiratory rate of 32 per minute is an indication of an ineffective breathing pattern. The elevated blood pressure and fatigue are indications of a compromised respiratory status. The problem of ineffective breathing pattern would be the priority for the client at this time.

Page Ref: 1130

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis

Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with COPD.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

6) The nurse is planning care for a client diagnosed with chronic obstructive pulmonary disease (COPD). Which interventions should the nurse select to address the client's ineffective breathing pattern? **Select all that apply.**
A) Instruct in pursed-lip breathing
B) Teach visualization and meditation
C) Deep breathing and coughing every hour
D) Instruct in abdominal breathing
E) Provide oxygen 2 liters nasal cannula.
Answer: A, B, D
Explanation: A) Techniques used to instruct a client to control the breathing pattern include pursed-lip breathing.
B) Techniques used to instruct a client to control the breathing pattern include relaxation such as visualization and meditation.
C) Deep breathing and coughing should be done every 2 hours to help keep the airway clear and prevent the pooling of secretions, not to control the breathing pattern.
D) Techniques used to instruct a client to control the breathing pattern include abdominal breathing.
E) Providing oxygen 2 liters per nasal cannula will not improve the client's breathing pattern.
Page Ref: 1131
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with COPD.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

7) A client diagnosed with chronic obstructive pulmonary disease (COPD) has a pulse oximetry reading of 93%, increased red blood cell and white blood cell counts, temperature of 101°F, pulse 100 bpm, respirations 35 bpm, and a chest x-ray that showed a flattened diaphragm with infiltrates. Based on this data, which prescription does the nurse question for this client?

A) Antibiotic therapy
B) Nonsteroidal anti-inflammatory agents (NSAIDs)
C) Oxygen by nasal cannula at 3-4 liters/minute
D) Bronchodilators such as adrenergic stimulating drugs or anticholinergic agents

Answer: C

Explanation: A) A prescription for antibiotics is expected for this client's condition.

B) NSAIDs is expected for this client's condition.

C) Based on the hypoxic drive theory and the need for hypoxia to stimulate breathing, oxygen saturation for clients with COPD should be greater than 90%. Therefore, this client may not require oxygen administration at this time, and oxygen at 3-4 L/min may lead to respiratory depression or respiratory failure.

D) Bronchodilators are expected for this client's condition.

Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with COPD.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

8) The nurse is planning care for a client diagnosed with chronic obstructive pulmonary disease (COPD). Which interventions should the nurse select to meet nutritional needs? **Select all that apply.**

A) Encourage a diet high in protein and fats.
B) Keep snacks to a minimum.
C) Provide frequent small meals with between-meal supplements.
D) Encourage carbohydrate-rich foods to provide needed calories for energy.
E) Suggest the client eat three meals per day to maintain energy needs.

Answer: A, C

Explanation: A) A diet high in protein and fats is recommended to minimize carbon dioxide production during metabolism.

B) Three meals with minimal snacking will not help maintain intake and reduce fatigue associated with eating.

C) Frequent small meals with between-meal supplements helps maintain intake and reduce fatigue associated with eating.

D) A diet without excess carbohydrates is recommended to minimize carbon dioxide production during metabolism.

E) Three meals may not be sufficient for the client's energy needs.

Page Ref: 1131

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Basic Care and Comfort

Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning

Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with COPD.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

9) The nurse is evaluating care provided to a client diagnosed with chronic obstructive pulmonary disease (COPD). Which observation would indicate that care provided to this client has been effective?

A) Client conducts morning care and ambulates in room while maintaining an oxygen saturation of 92% on room air per oximetry reading.

B) Client needs assistance with morning care and meals due to shortness of breath.

C) Client states family members are discussing admission to a nursing home for continuing care.

D) Client leaves hospital unit to smoke outside four times a day.

Answer: A

Explanation: A) Evidence that care provided to a client with COPD was successful would be the client conducting morning care and ambulating in the room while maintaining an oxygen saturation of 92%. This outcome identifies the client's ability to maintain adequate oxygenation and perform activities of daily living.

B) The client who needs assistance with morning care and meals because of shortness of breath needs additional interventions.

C) The client who states that family would prefer the client go to a nursing home may or may not have been positively affected by the interventions; not enough information is provided to know.

D) The client's leaving the unit to smoke suggests that care has not been effective.

Page Ref: 1132

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies:. 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation

Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with COPD.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

10) The nurse is planning care for a client diagnosed with chronic obstructive pulmonary disease (COPD). When planning care for this client, which interventions are appropriate to enhance the client's breathing pattern? **Select all that apply.**

A) Provide adequate rest periods.
B) Assist with activities of daily living (ADLs).
C) Educate on relaxation techniques.
D) Educate on pursed-lip breathing.
E) Administer a cough suppressant.

Answer: A, B, C, D

Explanation: A) Providing adequate rest periods prevents fatigue and reduces oxygen demands.
B) Assisting with ADLs prevents fatigue and reduces oxygen demands.
C) Relaxation techniques reduce anxiety and its effect on the respiratory rate.
D) Pursed-lip breathing helps keep airways open by maintaining positive pressure.
E) A cough suppressant is not an appropriate medication for a client with COPD as it is important for the client to expel mucus to maintain adequate oxygenation.

Page Ref: 1131
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Planning

Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with COPD.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

11) The nurse caring for a client diagnosed with chronic obstructive pulmonary disease (COPD) is educating the client on effective coughing techniques. Which statement made by the client indicates a need for further teaching?
A) "I should inhale by sniffing."
B) "I should exhale sharply with a ‘huff'."
C) "I should limit my fluid intake to 1-1.5 quarts daily."
D) "I should cough twice and then rest."
Answer: C
Explanation: A) The client should inhale by sniffing.
B) A sharp huff should be done when exhaling.
C) Adequate fluid intake is at least 2-2.5 quarts of fluid daily, so the statement about drinking 1-1.5 quarts daily indicates the need for further teaching.
D) The client should cough twice and then rest.
Page Ref: 1131
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with COPD.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

12) The nurse is assigned to care for a client admitted to the hospital with chronic obstructive pulmonary disease (COPD). Which medication does the nurse anticipate to decrease this client's risk for developing a respiratory infection?
A) A broad-spectrum antibiotic
B) A bronchodilator
C) A corticosteroid
D) An influenza vaccine
Answer: D
Explanation: A) A broad-spectrum antibiotic may be prescribed if infection is suspected but would not be ordered to reduce the risk of developing an infection.
B) Bronchodilators are not used to prevent infections.
C) Corticosteroids are not used to prevent infections.
D) An influenza vaccine may be ordered to reduce the risk of respiratory infections.
Page Ref: 1128
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with COPD.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

13) The nurse is providing care to a client recently diagnosed with chronic obstructive pulmonary disease (COPD). Which conditions will the nurse include when teaching the client's family about the types of COPD?
A) Asthma and bronchitis
B) Asthma and emphysema
C) Bronchitis and emphysema
D) Emphysema and atelectasis
Answer: C
Explanation: A) Asthma is not a type of COPD.
B) Asthma is not a type of COPD.
C) Although one or the other may dominate, COPD typically includes components of both chronic bronchitis and emphysema, two distinctly different processes.
D) Atelectasis is not a type of COPD.
Page Ref: 1124
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Describe the pathophysiology of COPD.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

14) Which reason should the nurse identify as a genetic cause of COPD?
A) Alpha-1 antitrypsin deficiency
B) A defect in the CFTR gene
C) A mutation in the superoxide dismutase 1 gene
D) Mutations in the human leukocyte antigen
Answer: A
Explanation: A) COPD can be caused by a genetic deficiency in alpha-1 antitrypsin, which is necessary for normal lung development and function.
B) A defect in the CFTR gene causes cystic fibrosis.
C) A mutation in the superoxide dismutase 1 gene causes amyotrophic lateral sclerosis (ALS), a neuromuscular disease that can reduce an individual's ability to control breathing muscles.
D) Certain mutations in the human leukocyte antigen (HLA) allele are associated with increased risk of sarcoidosis, which causes inflammatory cells to collect in the lungs.
Page Ref: 1124
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Describe the etiology of COPD.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

15) Which action should the nurse take to help reduce a client's risk for developing COPD?
A) Providing smoking cessation resources
B) Encouraging clients to receive vaccinations
C) Referring clients to a nutritionist
D) Providing references to local fitness facilities
Answer: A
Explanation: A) The primary cause of COPD is smoking, so nurses can reduce the risk of clients developing COPD by providing smoking cessation resources and encouraging clients to follow through with plans to stop smoking.
B) Vaccinations do not reduce the risk of developing COPD.
C) Nutrition changes do not reduce the risk of developing COPD.
D) Healthy exercise habits do not reduce the risk of developing COPD.
Page Ref: 1125

NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.C. Analyze chronic obstructive pulmonary disease (COPD) as it relates to oxygenation. Compare methods of preventing COPD.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with chronic obstructive pulmonary disease.

Exemplar 15.D Cystic Fibrosis

1) Which ion should the nurse identify that cannot be regulated in clients with cystic fibrosis?
A) Chloride
B) Sodium
C) Calcium
D) Potassium
Answer: A
Explanation: A) Cystic fibrosis stems from dysfunction of the CFTR protein, which controls movement of chloride into and out of cells.
B) Cystic fibrosis stems from dysfunction of the CFTR protein, which may also affect transport of sodium in the form of sodium chloride, but the primary ion affected is chloride.
C) Regulation of calcium is not affected in cystic fibrosis.
D) Regulation of potassium is not affected in cystic fibrosis.
Page Ref: 1135
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.D. Analyze cystic fibrosis as it relates to oxygenation. Describe the pathophysiology of cystic fibrosis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with cystic fibrosis.

2) A couple learns that they are both carriers of the CFTR gene for cystic fibrosis (CF). Which percent chance will this couple have of any offspring inheriting two abnormal genes and developing CF?
A) 100
B) 75
C) 50
D) 25
Answer: D
Explanation: A) There is not a 100% chance that the offspring will inherit two abnormal genes and develop CF.
B) There is not a 75% chance that the offspring will inherit two abnormal genes and develop CF.
C) When both parents are carriers of the CF gene, there is a 50% possibility that the child will be a carrier of one CF gene.
D) When both parents are carriers of the CF gene, each conception allows for a 25% possibility that two abnormal genes will be passed to the child. Each conception also allows for a 25% possibility that the child will not carry the CF gene.
Page Ref: 1136

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.D. Analyze cystic fibrosis as it relates to oxygenation. Summarize the risk factors for cystic fibrosis.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with cystic fibrosis.

3) Besides the respiratory system, which system would be critical for the nurse to assess in a client recently diagnosed with cystic fibrosis?
A) Nervous system
B) Gastrointestinal system
C) Musculoskeletal system
D) Urinary system
Answer: B
Explanation: A) Cystic fibrosis does not affect the nervous system.
B) In addition to respiratory alterations, clients with cystic fibrosis often have alterations to the gastrointestinal system. In particular, obstruction of pancreatic ducts by thick mucus impairs the production of pancreatic enzymes that are necessary for food digestion. This results in malnutrition, chronic diarrhea, and impaired insulin production.
C) Cystic fibrosis does not affect the musculoskeletal system.
D) Cystic fibrosis does not affect the urinary system directly.
Page Ref: 1136
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.D. Analyze cystic fibrosis as it relates to oxygenation. Identify the clinical manifestations of cystic fibrosis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with cystic fibrosis.

4) The nurse is caring for an 18-month-old client who is newly diagnosed with cystic fibrosis. The client is currently hospitalized due to a *Pseudomonas aeruginosa* infection in the lungs. The client's vital signs are P 138, R 43, T 101.3°F, BP 86/40, SpO_2 88%. The client is coughing up thick, green mucus. Which independent nursing intervention can the nurse implement to improve the client's oxygenation?
A) Administration of CFTR modulators
B) Percussion and postural drainage
C) Nutritional counseling
D) Teaching the client to cough into a tissue
Answer: B
Explanation: A) Administration of CFTR modulators is a collaborative intervention.
B) Percussion and postural drainage are chest physical therapy techniques that the nurse can implement to help clear the client's lungs of mucus, which will improve oxygenation.
C) Nutritional counseling is a collaborative intervention.
D) Teaching the client to cough into a tissue is an infection control measure. It will not improve oxygenation compared to any other type of coughing. In addition, the client is likely too young to understand and follow through with this teaching consistently.
Page Ref: 1138, 1142-1143
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.D. Analyze cystic fibrosis as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with cystic fibrosis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with cystic fibrosis.

5) A 7-year-old client is hospitalized due to complications related to cystic fibrosis. The nurse is responsible for administering medications and performing chest physical therapy. In which order should the nurse perform these actions?
A) Place the client in a position for postural drainage
B) Administer inhaled albuterol
C) Administer inhaled hypertonic saline
D) Perform percussion on the client's back and chest
E) Administer oxygen by nasal cannula
Answer: B, C, A, D, E
Explanation: Inhaled medications should be administered before placing the client in a position for postural drainage and performing percussion. In particular, albuterol, a bronchodilator, should be administered before chest physical therapy and before other inhaled medications. Therefore, albuterol should be administered first, followed by hypertonic saline. Then chest physical therapy should be performed by first placing the client in a position for postural drainage and then performing percussion on the client's back and chest. After the medications and therapy are completed, administration of oxygen by nasal cannula will be more effective.
Page Ref: 1146
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.D. Analyze cystic fibrosis as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with cystic fibrosis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with cystic fibrosis.

6) A pre-adolescent female client with cystic fibrosis asks when menstruation should begin. Which response by the nurse is correct?
A) "Usually, girls with cystic fibrosis start menstruating earlier than their peers."
B) "It is normal for girls with cystic fibrosis to start their period at age 16. Just be patient."
C) "Some girls with cystic fibrosis do not experience menstruation due to nutritional problems."
D) "Because secretions are thicker in people with cystic fibrosis, your period will be very heavy once it starts."
Answer: C
Explanation: A) Adolescent females do not usually start menstruating earlier than their peers.
B) Adolescent females do not usually start having menstrual periods at age 16.
C) Disease-related nutritional deficiencies may interfere with normal reproductive development, causing some girls with cystic fibrosis to not experience menstruation.
D) CF affects the thickness of mucus secretions, but it does not affect the thickness of the blood.
Page Ref: 1144
Cognitive Level: Analyzing
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 15.D. Analyze cystic fibrosis as it relates to oxygenation. Differentiate care of patients with cystic fibrosis across the lifespan.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with cystic fibrosis.

7) The nurse is providing teaching to the client who is pregnant and has cystic fibrosis. The nurse should explain that the client is at increased risk for which condition?
A) Emergency delivery
B) Gestational diabetes
C) Placenta previa
D) Spontaneous abortion
Answer: B
Explanation: A) Many clients are able to have a natural birth, so planning ahead for an emergency delivery is not necessary.
B) Because of changes in the secretion of insulin in many clients with cystic fibrosis, pregnant women who do not already have diabetes are at increased risk of developing gestational diabetes during pregnancy.
C) Cystic fibrosis does not increase the client's risk of placenta previa.
D) Cystic fibrosis does not increase the client's risk of spontaneous abortion.
Page Ref: 1090
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 15.D. Analyze cystic fibrosis as it relates to oxygenation. Differentiate care of patients with cystic fibrosis across the lifespan.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with cystic fibrosis.

Exemplar 15.E Respiratory Syncytial Virus/Bronchiolitis

1) The mother of a 5-month-old baby who attends daycare, is concerned because the child has developed a runny nose, cough, and low-grade fever over the last few days. These symptoms are consistent with which condition?
A) Meningitis
B) Respiratory syncytial virus (RSV)/ bronchiolitis
C) Bronchitis
D) The common cold
Answer: B
Explanation: A) A runny nose and cough are not symptoms associated with meningitis.
B) The typical clinical presentation of respiratory syncytial virus (RSV)/ bronchiolitis in otherwise healthy children begins 3-5 days after exposure to the virus. The early signs of a mild infection include rhinorrhea or a runny nose, cough, irritability, and a low-grade fever for 1-3 days.
C) Bronchitis has a distinctive cough and may or may not be associated with a fever.
D) A fever is not associated with the common cold.
Page Ref: 1151
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment

Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Identify the clinical manifestations of RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

2) The mother of an 8-month-old baby who has developed respiratory syncytial virus (RSV)/bronchiolitis wants to know which factors contribute to the risk of contracting RSV. Which response by the nurse is appropriate?
A) "There is a higher risk in children who are being breastfed."
B) "There is no way to avoid the illness."
C) "There is a higher risk in children who are exposed to secondary cigarette smoke."
D) "It is seen more frequently in children who do not attend daycare."
Answer: C
Explanation: A) The risk of infection with RSV is higher for infants and toddlers who are not breastfed.
B) RSV can be avoided by limiting risk factors.
C) The risk of infection with RSV is higher for infants and toddlers who live in homes with secondary cigarette exposure.
D) The risk of infection with RSV is higher for infants and toddlers who attend daycare.
Page Ref: 1151
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

3) The nurse observes a toddler, admitted with possible respiratory syncytial virus (RSV)/ bronchiolitis, grunting with expiration. Which action by the nurse is appropriate?
A) Assist the child to clear the nasal passages.
B) Limit fluids.
C) Suction the airway to relieve the obstruction.
D) Lay the child on his back.
Answer: C
Explanation: A) Assisting the child to clear the nasal passages would be applicable if the child were experiencing rhinorrhea.
B) Fluids should be increased to thin secretions.
C) Grunting is seen with partial airway obstruction caused by increased secretions and edema. The nurse should suction the airway to relieve the obstruction.
D) Laying the child on his back will not improve the child's ability to breathe.
Page Ref: 1154
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

4) The nurse assesses fatigue in an infant with acute bronchiolitis due to respiratory syncytial virus (RSV). Which problem would be most appropriate for the infant?
A) Acute pain
B) Inadequate perfusion of tissues
C) Inability to tolerate activity
D) Decreased cardiac output
Answer: C
Explanation: A) Pain is not usually associated with acute bronchiolitis.
B) Tissue perfusion is not affected by this respiratory disease process.
C) Activity intolerance is a problem because of the imbalance between oxygen supply and demand. Increased levels of fatigue may indicate the disease is more severe.
D) Cardiac output is not compromised during an acute phase of bronchiolitis.
Page Ref: 1154
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

5) The nurse is planning care for a child with respiratory syncytial virus (RSV)/ bronchiolitis. Which interventions should the nurse use to promote airway clearance? **Select all that apply.**

A) Weigh daily.
B) Monitor vital signs and pulse oximetry.
C) Remove secretions with a bulb syringe.
D) Weigh diapers.
E) Provide frequent rest periods.

Answer: B, C

Explanation: A) Weighing daily would be appropriate for a problem with nutrition.
B) Interventions appropriate to promote airway clearance include monitoring vital signs and pulse oximetry
C) Interventions appropriate to promote airway clearance include removing secretions with a bulb syringe.
D) Weighing diapers would be appropriate for a problem with fluid balance.
E) Frequent rest periods would be appropriate for a problem with activity tolerance.

Standards: QSEN Competencies: III.A.2 Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

6) An infant with respiratory syncytial virus (RSV)/ bronchiolitis is prescribed intubation to maintain an adequate airway. With which healthcare professional will the nurse collaborate to maintain the endotracheal tube and ventilation?
A) An advanced practice nurse
B) The primary healthcare provider
C) A respiratory therapist
D) A play therapist
Answer: C
Explanation: A) The advanced practice nurse is not responsible for maintaining the client's endotracheal tube and ventilation.
B) Infants who need endotracheal intubation will be closely cared for by the respiratory therapist. The primary healthcare provider is not responsible for maintaining the client's endotracheal tube and ventilation.
C) Infants who need endotracheal intubation will be closely cared for by the respiratory therapist.
D) The play therapist is not responsible for maintaining the client's endotracheal tube and ventilation.

Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

7) Which prevention strategies would be the most beneficial for the nurse to discuss with the parents of a child who has had repeated admissions for respiratory syncytial virus (RSV)/ bronchiolitis? **Select all that apply.**
A) Do not smoke and avoid all secondhand smoke around the child.
B) Practice frequent hand washing.
C) Encourage physical activity and play.
D) Consider alternatives to sending the child to daycare.
E) Ensure an adequate nutritional intake.
Answer: A, B, D
Explanation: A) Exposure to cigarette smoke and attending daycare are both risk factors for RSV/bronchiolitis. The nurse should discuss with the parents smoking cessation.
B) Frequent hand washing is a primary prevention method for RSV, so this should be practiced by the parents.
C) Physical activity is good for maintaining general health but is not specific for preventing RSV/bronchiolitis.
D) The nurse should discuss with the parents an alternative method of childcare.
E) Nutritional intake is good for maintaining general health but is not specific for preventing RSV/bronchiolitis.
Page Ref: 1151
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Summarize the risk factors for RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

8) The nurse is providing care to a client diagnosed with respiratory syncytial virus (RSV)/ bronchiolitis. Which assessment finding indicates that treatment has been effective?
A) Client ingesting small amounts of clear fluids when encouraged
B) Client resting in bed with limited interest in play or activities
C) Client respiratory rate within normal limits for age
D) Client coughing copious amounts of green sputum and requires occasional suctioning
Answer: C
Explanation: A) The client who is ingesting small amounts of fluids might still be experiencing thickened secretions.
B) The client who is resting in bed with limited interest in play or activities is not demonstrating an improvement in respiratory status.
C) Evidence that care is effective would include normal rate, rhythm, and quality of the breathing patterns for the client's age.
D) If the client is coughing copious amounts of green sputum and requiring occasional suctioning, the interventions have not been effective, as the child still needs assistance with clearing the airway.
Page Ref: 1155
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Evaluation
Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

9) The clinic nurse is educating a group of new moms on the risk factors and prevention of respiratory syncytial virus (RSV). What action should the nurse stress as the best way to prevent RSV?
A) Hand washing
B) Monitoring temperature
C) Administering antibiotics
D) Limiting fluid intake
Answer: A
Explanation: A) The best way to prevent RSV is through good hand hygiene and infection-control measures.
B) Monitoring temperature would not prevent infection but would be appropriate for monitoring infection.
C) Administering antibiotics is usually ordered by the physician when a bacterial infection is suspected, not a viral infection.
D) There is no indication of the need to limit fluids, which could potentially produce other complications.
Page Ref: 1151
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Compare methods for preventing RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

10) Which population should the nurse assigned to care for pediatric clients recognize as having the highest risk of hospitalization due to RSV?
A) Alaskan Native infants
B) African American infants
C) Native American infants
D) Asian American infants
Answer: A
Explanation: A) RSV is a major cause of hospitalization among Alaskan Native infants.
B) RSV is not a major cause of hospitalization among African American infants.
C) RSV is not a major cause of hospitalization among Native American infants.
D) RSV is not a major cause of hospitalization among Asian American infants.
Page Ref: 1151

Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Describe the etiology of RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

11) The nurse working in the emergency department (ED) is assessing an infant client. Which findings does the nurse anticipate in a child diagnosed with respiratory syncytial virus (RSV)? **Select all that apply.**

A) Rhinorrhea
B) Irritability
C) Grunting
D) Bradypnea
E) Tachypnea

Answer: A, C, E

Explanation: A) The early signs of RSV include rhinorrhea.
B) Irritability is not identified as a symptom of RSV.
C) Grunting can occur as respiratory system is compromised.
D) Bradypnea is not a symptom of RSV.
E) Symptoms of RSV include tachypnea.

Page Ref: 1151
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Identify the clinical manifestations of RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

12) The nurse is developing a plan of care for a toddler diagnosed with respiratory syncytial virus (RSV). Which intervention is inappropriate for this client?
A) Offer small, frequent meals.
B) Encourage to ambulate frequently.
C) Encourage oral intake.
D) Monitor intake and output.
Answer: B
Explanation: A) Small frequent meals is appropriate for this client.
B) It would not be appropriate to encourage frequent ambulation. Nursing interventions should be introduced in an effort to reduce fatigue, such as allowing rest periods.
C) Encouraging oral intake is appropriate for this client.
D) Monitoring intake and output is appropriate for this client.
Page Ref: 1155
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Apply the nursing process in providing culturally competent care to an individual with RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

13) Which body cells will the nurse identify as being involved in an infection by respiratory syncytial virus (RSV)?
A) Smooth muscle cells in the bronchi and bronchioles
B) Granular pneumonocytes in the alveoli
C) Squamous epithelial cells of the bronchioles and alveoli
D) Macrophages and monocytes of the bronchioles and alveoli
Answer: C
Explanation: A) Respiratory syncytial virus does not infect smooth muscle cells.
B) Respiratory syncytial virus does not infect granular pneumonocytes (the surfactant-secreting cells).
C) Respiratory syncytial virus infects the squamous epithelial cells of the bronchioles and alveoli.
D) Respiratory syncytial does not infect the macrophages and monocytes.
Page Ref: 1151
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Describe the pathophysiology of RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

14) The nurse is providing care to a 7-month-old child hospitalized with RSV/bronchiolitis. The nurse can expect to provide client teaching to the parents about which medication?
A) Corticosteroids
B) Nebulized epinephrine
C) Antibiotics
D) Nebulized hypertonic saline
Answer: D
Explanation: A) Corticosteroids are not recommended for clients with RSV/bronchiolitis.
B) Nebulized epinephrine is no longer recommended for clients with RSV/bronchiolitis.
C) Because RSV is a virus, antibiotics should not be used.
D) Nebulized hypertonic saline is used to promote mucociliary clearance in hospitalized clients with RSV/bronchiolitis.
Page Ref: 1153
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with RSV/bronchiolitis.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

15) The nurse is assessing an adult client with respiratory syncytial virus (RSV). Which symptom will the nurse expect to assess that is absent in infants with RSV?
A) Rhinorrhea
B) Cough
C) Apnea
D) Headache
Answer: D
Explanation: A) Rhinorrhea is common in both infants and adults with RSV.
B) Cough is common in both infants and adults with RSV.
C) Apnea is more commonly seen in infants, not in adults.
D) Headaches are more commonly assessed in adults with RSV and not infants.
Page Ref: 1153
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Differentiate care of patients with RSV/bronchiolitis across the lifespan.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

16) Which outcome should the nurse select for a 78-year-old resident of a long-term care facility to prevent RSV?
A) The client's airways will remain clear of secretions.
B) The client's fluid intake will meet daily requirements of 2000 mL per day.
C) The client will demonstrate knowledge of proper hand washing techniques.
D) The client will meet daily nutritional needs as provided by a nutritionist.
Answer: C
Explanation: A) An outcome related to airways remaining clear of secretions is more appropriate for an individual who already has RSV.
B) An adequate fluid intake will be beneficial for the client but is not specifically related to preventing infection.
C) RSV is spread by direct contact with contaminated surfaces or an infected individual, so use of proper hand washing techniques can help prevent infection in susceptible individuals.
D) Meeting daily nutritional needs will be beneficial for the client but is not specifically related to preventing infection.
Page Ref: 1151
Cognitive Level: Applying
Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: I.A.1. Learning Outcome: 15.E. Analyze RSV/bronchiolitis as it relates to oxygenation. Differentiate care of patients with RSV/bronchiolitis across the lifespan.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with respiratory syncytial virus/bronchiolitis.

Exemplar 15.F Sudden Infant Death Syndrome

1) The pediatric nurse is providing education to a new mother regarding ways to decrease the risk of sudden infant death syndrome (SIDS). Which statement by the nurse is appropriate?
A) "You should keep the baby with you at all times to assess for apnea."
B) "Make sure the baby has a soft blanket and pillow when sleeping."
C) "It is recommended that you place your baby on his back for sleep."
D) "SIDS has been linked to immunizations. I recommend that you avoid immunizing your baby."
Answer: C
Explanation: A) Keeping the infant with the mother at all times is unreasonable and will not prevent SIDS.
B) Soft pillows and blankets also increase the risk for SIDS, so they should not be used.
C) A side-lying or prone position increases the infant's risk of SIDS, so the mother should be taught to always place the baby on his back for sleep
D) Immunizations have no known link to SIDS.
Page Ref: 1157
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Summarize the risk factors for SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

2) The nurse is instructing new parents on ways to decrease the risk of sudden infant death syndrome (SIDS) with their newborn son. Which information should be included in these instructions? **Select all that apply.**

A) There is nothing that can be done, so requirements for toys and bedding are of no consequence.

B) Instruct that it is more common in babies from ages 6 months to 18 months.

C) Avoid placing the baby in the prone or side-lying position for sleep.

D) Remind the parents that the syndrome is more common in females than males, and that they have a male child.

E) Do not smoke near the child and reduce all exposure to secondhand smoke.

Answer: C, E

Explanation: A) There are several actions that can be done to prevent the risk of SIDS.

B) Risk factors for SIDS include being under 6 months of age.

C) Sleeping in the prone or side-lying position is a risk factor for the syndrome.

D) Being male is a risk factor for SIDS.

E) The nurse should instruct the parents to not smoke and to reduce all exposure to secondhand smoke to reduce the child's risk of SIDS.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Summarize the risk factors for SIDS.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

3) When assessing the risk of a newborn for sudden infant death syndrome (SIDS), which are risk factors that the nurse should consider? **Select all that apply.**
A) Race
B) Gender
C) Father's age
D) Age
E) Eye color
Answer: A, B, D
Explanation: A) SIDS is most common in American Indians and Alaska Natives, followed by non-Hispanic Blacks, non-Hispanic Whites, Hispanics, and Asian or Pacific Islanders.
B) SIDS is most common in males than in females.
C) Father's age is not related to the risk of SIDS.
D) SIDS is most common in infants under 6 months of age.
E) Infant eye color is not related to the risk of SIDS.

Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Summarize the risk factors for SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

4) The nurse is providing parenting teaching regarding reducing the risk of sudden infant death syndrome (SIDS). Which teaching point is a priority for the nurse to include?
A) Instruct on side-lying and face-down positions when in the crib.
B) Instruct on face-up position when in the crib.
C) Ensure adequate nutritional intake for the mother and newborn.
D) Encourage good hand washing.
Answer: B
Explanation: A) Side-lying and face-down positions are associated with a higher risk of the syndrome and should not be instructed.
B) The nurse should instruct the mother to place the baby in the face-up position when in the crib.
C) Adequate nutrition does not prevent SIDS.
D) Good hand washing does not prevent SIDS.
Page Ref: 1157
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Implementation
Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Apply the nursing process in providing culturally competent care for a family experiencing SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

5) The nurse is planning care for a baby born to a mother who smoked during the pregnancy. The mother states that she believes in bed sharing. Which problem would be appropriate for this baby?
A) Potential for SIDS
B) Readiness to improve parenting skills
C) Anxiety
D) Lack of knowledge about SIDS
Answer: A
Explanation: A) The most important problem for the baby at this time is the potential for SIDS. Both bed sharing and the mother smoking during pregnancy are risk factors for SIDS.
B) Readiness to improve parenting skills is a problem for the parent.
C) Anxiety is a problem for the parent.
D) Lack of knowledge about SIDS is a problem for the parent.

Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Relationship Centered Care: Effective communication. | Nursing Process: Diagnosis
Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Apply the nursing process in providing culturally competent care for a family experiencing SIDS.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

6) The nurse is planning care for a new mother who smoked during the pregnancy and whose sister lost a child to sudden infant death syndrome (SIDS). Which interventions are appropriate for the nurse to include in the plan of care for the new mother and baby? **Select all that apply.**
A) Information on bottle-feeding the infant
B) Reasons why the child should sleep with others
C) Ages at which the child should receive immunizations
D) Using bedding that is firm
E) Smoking cessation information
Answer: D, E
Explanation: A) The method of feeding is not associated with the syndrome; however, the risk is decreased with breastfeeding, not bottle feeding.
B) Sleeping with others will increase the child's risk of the syndrome and should not be in the plan of care.
C) While age-appropriate immunizations are important for the overall health of the baby, this intervention does not specifically reduce the risk for SIDS.
D) The nurse should instruct the mother to use bedding that is firm.
E) The plan of care to decrease the child's risk of SIDS should include habits to lower the risk of SIDS, one of which is smoking cessation.

WW.TBSM.WS

Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Compare methods for preventing SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

7) The nurse is placing a newborn baby in the nursery crib with the baby's back down. The mother tells the nurse that she doubts the baby will be able to sleep that way, as all the family members sleep on their stomachs. Which action by the nurse is appropriate?
A) Instruct the mother that placing the baby on the back will reduce the risk of sudden infant death syndrome (SIDS) and it will not interfere with sleep.
B) Place the baby on the stomach.
C) Suggest the mother place the baby on the stomach when at home.
D) Instruct the mother that babies do not really care in which position they are in but placing on the back is easier to provide care.
Answer: A
Explanation: A) The nurse should instruct the mother that placing the baby on the back will reduce the risk of sudden infant death syndrome, and it will not interfere with the baby's ability to sleep.
B) The nurse should not place the baby on the stomach.
C) The nurse should not suggest that the mother place the baby on the stomach when at home.
D) Placing the baby on the back does not necessarily make it easier to provide care.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

WwW.EbSm.Ws

8) The nurse is providing supportive care for the parents of an infant who died from sudden infant death syndrome (SIDS). Which action by the nurse is appropriate?
A) Advising the parents that an autopsy is not necessary
B) Refraining from recommending support groups until after the investigation
C) Interviewing the parents to determine the cause of the SIDS incident
D) Contacting the family's spiritual leader for support
Answer: D
Explanation: A) An autopsy will be necessary.
B) Support groups should not be delayed for the investigation.
C) Interviews to determine the cause of death will be the responsibility of the medical examiner and law enforcement agents, not the nurse.
D) The family will need emotional support during this time, including support from the family's spiritual leader.
Page Ref: 1159
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: III.A.2. Describe EBP to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation
Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of a family experiencing SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

9) The nurse is evaluating care provided to a new mother whose infant is at risk for sudden infant death syndrome (SIDS). Which statement by the mother indicates teaching has been effective?
A) "I need to purchase loose-fitting sheets and blankets for the bed."
B) "I plan to quit smoking."
C) "I will place my baby in a side-lying position for sleep."
D) "I will bottle-feed my baby since breastfeeding is a risk factor for SIDS."
Answer: B
Explanation: A) Loose-fitting sheets and blankets are associated with an increased risk for the syndrome.
B) If the mother of an infant at risk for SIDS expresses her plan to quit smoking, the nursing care has been effective.
C) The prone and side-lying positions increase the risk for the syndrome.
D) The feeding method is not implicated with the syndrome and would not be used to evaluate the plan of care for an infant at risk for SIDS.
Page Ref: 1159

Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Apply the nursing process in providing culturally competent care for a family experiencing SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

10) A nurse is preparing to educate a group of parents on sudden infant death syndrome (SIDS). Which variables should the nurse highlight as contributing to increased risk of SIDS? **Select all that apply.**
A) Prone sleeping
B) Side sleeping
C) Loose bedding
D) Bed sharing
E) Supine sleeping
Answer: A, B, C, D
Explanation: A) Infants in the prone position are vulnerable because the brainstem abnormality compromises their protective reflexes, such as arousal and head turning, when experiencing asphyxia.
B) Infants in the side-lying position are vulnerable because the brainstem abnormality compromises their protective reflexes, such as arousal and head turning, when experiencing asphyxia.
C) Significant stressors contributing to SIDS include loose bedding.
D) Significant stressors contributing to SIDS include bed sharing.
E) Supine sleeping is a method to decrease the risk for SIDS.

Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Summarize the risk factors for SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

11) The student nurse attends a workshop on culture and diversity with regard to sudden infant death syndrome (SIDS) and is now aware that the rate of occurrence is highest among which group of infants?
A) American Indians
B) Whites
C) Asians
D) Hispanics
Answer: A
Explanation: A) Rates of SIDS are highest for American Indians and Alaska Natives.
B) Rates of SIDS are not highest for Whites.
C) Rates of SIDS are lowest for Asians.
D) Rates of SIDS are lowest for Hispanics.

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

12) The nurse is planning care for the parents of an infant who died as the result of sudden infant death syndrome. Which collaborative interventions does the nurse plan when providing care to these parents? **Select all that apply.**

A) A psychosocial assessment
B) A grief counselor referral
C) A psychotherapist referral
D) A visit from the chaplain
E) A respiratory therapist referral

Answer: A, B, C, D

Explanation: A) The parents' grief will be acute, and they should receive a psychosocial assessment at each healthcare interaction.
B) Collaborative care for the parents may include grief counselors.
C) Collaborative care for the parents may include psychotherapists.
D) Collaborative care for the parents may include chaplains and religious leaders.
E) A respiratory therapist referral is inappropriate for this situation.

Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of a family experiencing SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

13) The nurse is preparing to educate a group of parents on sudden infant death syndrome (SIDS). Which intervention is appropriate to decrease an infant's risk for SIDS?
A) Using firm bedding
B) Ensuring the room temperature is at least 80°F at all times
C) Recommending bed sharing
D) Placing the infant in a prone position for sleeping
Answer: A
Explanation: A) Using firm bedding is an appropriate intervention to decrease the risk of SIDS.
B) A specific room temperature is not identified to reduce the risk for SIDS.
C) Bed sharing should be discouraged and avoided to reduce the risk for SIDS.
D) The prone position should be avoided and discouraged to reduce the risk for SIDS.
Page Ref: 1158
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Implementation

MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

14) At which time would sudden infant death syndrome (SIDS) be diagnosed?

A) When an autopsy reveals a brainstem defect
B) When an infant dies after being shaken violently
C) When an autopsy fails to find a cause of death
D) When an infant is found dead in their crib
Answer: C
Explanation: A) Although a brainstem defect related to respiratory and autonomic responses must be present, this is not usually found through autopsy.
B) Infants who die after being shaken violently have shaken baby syndrome, not SIDS.
C) SIDS is only diagnosed after a review of the child's clinical history, an examination of the scene of death, and an autopsy that fails to find a cause of death.
D) An infant found dead in their crib may have died from other causes rather than SIDS.
Page Ref: 1156
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Describe the pathophysiology of SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

15) In which way does a brainstem abnormality contribute to the risk of SIDS when an infant is placed on his stomach to sleep?
A) It decreases the infant's arousal and head turning responses during times of asphyxia.
B) It decreases the infant's respiratory drive during NREM sleep.
C) It increases periods of apnea, resulting in hypoxia and unconsciousness.
D) It increases the risk of aspiration and airway obstruction.
Answer: A
Explanation: A) A brainstem abnormality, when combined with a stressor such as sleeping in the prone position in a child in the first 6 months of life, will often result in SIDS due to a decreased arousal and head turning response during times of asphyxia.
B) A brainstem abnormality does not decrease the respiratory drive during NREM sleep.
C) A brainstem abnormality does not increase periods of apnea.
D) A brainstem abnormality does not increase the risk of aspiration and airway obstruction.

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Assessment
Learning Outcome: 15.F. Analyze sudden infant death syndrome (SIDS) as it relates to oxygenation. Describe the etiology of SIDS.
MNL LO: Demonstrate understanding of the concept of oxygenation in the care of a patient with sudden infant death syndrome.

Nursing: A Concept-Based Approach to Learning Vol. 1 & 2, 4e (Pearson)
Module 16 Perfusion

The Concept of Perfusion

1) A pregnant client in the third trimester of pregnancy asks why an extra heart sound has developed since the last examination. Which response by the nurse is appropriate?
A) "You will need to have an echocardiogram to determine the reason for the extra sound."
B) "You are likely experiencing heart failure due to the extra fluid that accumulates during this time in pregnancy."
C) "You have what is known as a ventricular gallop, and it can be a normal finding during this trimester of pregnancy."
D) "You have what is known as atrial gallop, and this is cause for concern."
Answer: C
Explanation: A) There is no need for an echocardiogram.
B) While the S_3 sound can be associated with heart failure, this is not the case during pregnancy.
C) The third heart sound (S_3) may be heard in pregnant females during the third trimester. It is heard after S_2 and is termed a *ventricular gallop*. When the atrioventricular (AV) valves open, blood flow into the ventricles may cause vibrations. These vibrations create the S_3 sound during diastole.
D) S_4, also known as an *atrial gallop,* can be present in healthy individuals; however, it is not associated with pregnancy.
Page Ref: 1168

Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.1. Analyze the physiology of perfusion in the body.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

2) The nurse is concerned that a client with an alteration in perfusion is at risk for inadequate oxygenation. Which intervention should the nurse add to the client's plan of care?
A) Encouraging ambulation every 30 minutes
B) Instructing on deep breathing
C) Administering medications appropriate to increase heart rate
D) Positioning to increase blood return
Answer: B
Explanation: A) Encouraging ambulation every 30 minutes would negatively impact oxygenation. Periods of rest should occur between activities, and no activity should be too strenuous.
B) The client is at risk for inadequate oxygenation. The nurse should consider teaching the client the importance of deep breathing to increase the amount of oxygen in the body tissues.
C) The nurse should consider medications that would reduce instead of increase the heart rate.
D) The client should be in the high-Fowler position to improve oxygenation. Positions to increase blood flow to the heart include Trendelenburg, which would negatively impact oxygenation.
Page Ref: 1182
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.3. Outline the relationship between perfusion and other concepts.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

3) An older adult client is diagnosed with cardiomyopathy and a cardiac dysrhythmia. Which medication would the nurse expect to be prescribed for this client?
A) Beta blocker
B) Digoxin
C) Nitrate medications
D) Fluids
Answer: A
Explanation: A) Treatment for cardiomyopathy includes calcium channel blockers, beta blockers, and antiarrhythmics.
B) Digoxin should be avoided because it increases the force of contractions.
C) Nitrates should be avoided because they increase blood pressure.
D) The client should be on a sodium and fluid restriction and not be encouraged to drink fluids.
Page Ref: 1179
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.2. Differentiate alterations in perfusion.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

4) The nurse is instructing a client on lifestyle changes to promote a healthy cardiovascular system. Which information should be included in this teaching session? **Select all that apply.**
A) Limit exercise to 15 minutes a day
B) Reduce saturated fats in the diet
C) Avoid cigarette smoking
D) Wear elastic hose
E) Limit fluid intake
Answer: B, C
Explanation: A) Clients should exercise for at least 30 minutes most days of the week to maintain a healthy cardiovascular system.
B) Interventions that help promote a healthy cardiovascular system include reducing saturated fats in the diet.
C) Interventions that would help promote a healthy cardiovascular system include avoiding cigarette smoking.
D) Wearing elastic hose is not known to contribute to a healthy cardiovascular system.
E) Limiting fluid intake is not known to contribute to a healthy cardiovascular system.
Page Ref: 1183
Cognitive Level: Applying
Client Need/Sub: Health Promotion and Maintenance
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Implementation
Learning Outcome: 16.4. Explain the promotion of healthy perfusion.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

5) The nurse is preparing to conduct a cardiac assessment for a pediatric client. Which location will the nurse use when auscultating the apical pulse?
A) At the fifth intercostal space
B) At the left nipple
C) At the right nipple
D) At the eighth intercostal space
Answer: B
Explanation: A) The apical pulse is not auscultated at the fifth intercostal space in a pediatric client.
B) When assessing a pediatric client, it may be more beneficial to auscultate the apical pulse in the area of the left nipple at the fourth intercostal space.
C) The apical pulse is not auscultated at the right nipple in a pediatric client.
D) The apical pulse is not auscultated at the eighth intercostal space in a pediatric client.
Page Ref: 1187
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.8. Differentiate considerations related to the assessment and care of patients with alterations in perfusion throughout the lifespan.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

6) The nurse is caring for a client who is scheduled to receive metoprolol (Lopressor). Which information should the nurse teach the client about this medication?
A) Expect a rapid heart rate.
B) Change positions slowly.
C) Reduce protein intake.
D) Increase fluids.
Answer: B
Explanation: A) This medication does not cause a rapid heart rate.
B) Metoprolol is a beta blocker. The client should be instructed to use care when ambulating and to change positions slowly because this medication causes orthostatic hypotension.
C) Protein restriction is not indicated with this medication.
D) The client should not be instructed to increase fluids.
Page Ref: 1202
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Implementation
Learning Outcome: 16.7. Summarize collaborative therapies used by interprofessional teams for patients with alterations in perfusion.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

7) Which statements are correct regarding the various layers of the heart? **Select all that apply.**
A) The endocardium covers the entire heart and great vessels.
B) The endocardium is the muscular layer of the heart that contracts during each heartbeat.
C) The outermost layer of the heart is the epicardium.
D) The myocardium consists of myofibril cells.
E) The myocardium has four layers.
Answer: C, D
Explanation: A) The endocardium, which is the innermost layer, is a thin membrane composed of three layers.
B) The myocardium is the muscular layer of the heart that contracts during each heartbeat.
C) The outermost layer of the heart is the epicardium.
D) The myocardium, the middle layer of the heart wall, consists of specialized cardiac muscle cells (myofibrils).
E) The myocardium, the middle layer of the heart wall, consists of specialized cardiac muscle cells (myofibrils).

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.1. Analyze the physiology of perfusion in the body.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

8) A client's stroke volume (SV) is 85mL/beat and the heart rate (HR) is 71 beats per minute (bpm). What is the client's cardiac output (CO) rounded to the nearest liter?
Answer: 6 Liters (L)
Explanation: $CO = SV \times HR$
$85mL = 0.085\ L$
$CO = 0.085 \times 71 = 6.035 = 6\ L$
Page Ref: 1171
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise, and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.1. Analyze the physiology of perfusion in the body.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

9) Which factor is least likely to influence blood pressure?
A) Pumping action of the heart
B) Peripheral vascular resistance
C) Heart rate
D) Blood volume
Answer: C
Explanation: A) The factors that determine blood pressure include the pumping action of the heart.
B) The factors that determine blood pressure include the peripheral vascular resistance.
C) Heart rate by itself does not determine blood pressure.
D) The factors that determine blood pressure include blood volume and viscosity.
Page Ref: 1175
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.1. Analyze the physiology of perfusion in the body.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

10) Which nursing intervention related to perfusion can be performed independently?
A) Administration of drug regimens
B) Insertion of device to measure central venous pressure (CVP)
C) Teaching relaxation techniques
D) Thoracentesis

Answer: C
Explanation: A) The nurse must administer drug regimens only under the order of a physician or nurse practitioner.
B) Although nurses can monitor central venous pressure, they are not responsible for inserting the device to measure CVP.
C) The nurse can teach relaxation techniques as an independent intervention to provide psychosocial support to the client.
D) A physician or nurse practitioner usually performs a thoracentesis.
Page Ref: 1196-1197
Cognitive Level: Remembering
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: II.A.2. Describe scopes of practice and roles of healthcare team members. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.6. Analyze independent interventions nurses can implement for patients with alterations in perfusion.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

11) The nurse is reviewing objective data obtained during the assessment of a pregnant woman in her 34th week of gestation. Which finding would be cause for concern?
A) Pulse 103 bpm
B) Blood pressure 108/70
C) Hematocrit 24%
D) WBC count 10,340/mm^3
Answer: C
Explanation: A) The pulse normally increases by 10-15 bpm during pregnancy.
B) During pregnancy, blood pressure decreases slightly.
C) During pregnancy, red blood cell (RBC) production and plasma volume increase, but because plasma volume increases more than RBC volume, the hematocrit decreases slightly. However, this client is experiencing a significant decrease in hematocrit, indicating insufficient production of RBCs.
D) During pregnancy, WBC count increases.

Learning Outcome: 16.8. Differentiate considerations related to the assessment and care of patients with alterations in perfusion throughout the lifespan.
MNL LO: Analyze the concept of perfusion and its application to nursing care.

WwW.TeSm.Ws

Exemplar 16.A Cardiomyopathy

1) The nurse is caring for a client diagnosed with dilated cardiomyopathy. Which clinical manifestations does the nurse anticipate during the physical assessment? **Select all that apply.**
A) Fatigue
B) Lower extremity edema
C) Syncope
D) Dyspnea
E) Angina
Answer: A, B, D
Explanation: A) Clinical manifestations of dilated cardiomyopathy include fatigue.
B) Clinical manifestations of dilated cardiomyopathy include peripheral edema.
C) Syncope is commonly associated with hypertrophic cardiomyopathy and other forms of cardiomyopathy, but not with dilated cardiomyopathy.
D) Clinical manifestations of dilated cardiomyopathy include dyspnea.
E) Angina is commonly associated with hypertrophic cardiomyopathy and other forms of cardiomyopathy, but not with dilated cardiomyopathy.
Page Ref: 1212
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Identify the clinical manifestations of cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

2) A client states to the nurse, "I know I have high blood pressure, but I don't want to take medication." Based on this data, which health problem is the client at risk for developing?
A) Gastritis
B) Diabetes
C) Cardiomyopathy
D) Metabolic syndrome
Answer: C
Explanation: A) Hypertension has not been associated with gastritis.
B) Hypertension has not been associated with diabetes.
C) Hypertension places the client at risk for development of cardiomyopathy.
D) Hypertension has not been associated with metabolic syndrome.
Page Ref: 1212
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.5. Examine common barriers to active involvement of clients in their own healthcare processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Assessment
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Compare the risk factors and prevention of cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

3) A client diagnosed with cardiomyopathy reports having to rest between activities during the day. The client asks the nurse why this is occurring. Which reason should the nurse include in the response to the client?

A) Increased stroke volume
B) Decreased cardiac output
C) An elongated and dilated aorta
D) Increased blood pressure

Answer: B

Explanation: A) It is unknown if the client has increased stroke volume.

B) Decreased cardiac output is a result of decreased efficiency and contractibility of the myocardium. Rest could be required after each activity that puts physiological stress on the heart. Less blood is pumped from the heart to the rest of the body with a decreased cardiac output, and this has a direct effect on the activity level that can be tolerated.

C) It is unknown if the client has an elongated and dilated aorta.

D) It is unknown if the client has high blood pressure.

Page Ref: 1216

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation

Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with cardiomyopathy.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

4) A client admitted with the diagnosis of cardiomyopathy becomes short of breath with ambulation and eating and fatigued with routine care activities. For which problem will the nurse plan this client's care?
A) Fluid volume excess
B) Lack of knowledge of disease process
C) Inability to tolerate activity
D) Inability to care for self
Answer: C
Explanation: A) There is not enough information to determine if the client has an excess in fluid volume.
B) There is not enough information to determine if the client lacks knowledge of the disease process.
C) The client is short of breath with ambulation and eating and fatigued with routine care activities. The problem of inability to tolerate activity applies to the client at this time.
D) There is not enough information to determine if the client is unable to care for self.
Page Ref: 1216
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.B.1. Elicit client values, preferences and expressed needs as part of clinical interview, implementation of care plan and evaluation of care. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Diagnosis
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with cardiomyopathy.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

5) The nurse identifies the problem of imbalanced fluid volume as appropriate for a client with cardiomyopathy. Which interventions should the nurse emphasize when planning this client's care? **Select all that apply.**

A) Monitor B-type natriuretic peptide (BNP) level.
B) Provide oxygen as prescribed.
C) Assess respiratory status and lung sounds every 4 hours and as needed.
D) Provide information about activity upon discharge.
E) Monitor intake and output.

Answer: C, E

Explanation: A) Monitoring BNP level is appropriate for the problem of altered cardiac output.
B) Providing oxygen is appropriate for the problem with altered oxygenation.
C) Interventions appropriate for the problem of excess fluid include assessing respiratory status and lung sounds every 4 hours and as needed.
D) Providing information about activity upon discharge would be appropriate for the problem about activity.
E) Interventions appropriate for the problem of excess fluid include monitoring intake and output.

Page Ref: 1216-1217
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

6) The nurse is providing teaching to a client diagnosed with cardiomyopathy. Which statement made by the client indicates the discharge teaching was effective?
A) "I will exercise as much as possible, regardless of feeling weak and short of breath."
B) "My pants getting tight around the waist means I'm eating too much and should cut back on food."
C) "I will eat foods containing sodium only if drinking water with them."
D) "I will see my cardiologist next week to discuss implanting a pacemaker."
Answer: D
Explanation: A) Exercise when feeling weak and short of breath indicates the client needs additional instruction and follow-up.
B) Snug pants around the waist indicates the client needs more teaching.
C) Eating foods with sodium and drinking water indicates the client needs more teaching.
D) Pacemakers are needed in some clients with cardiomyopathy to prevent sudden cardiac death. The client should discuss the need for a pacemaker with his cardiologist.
Page Ref: 1214
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Evaluation

Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

7) The nurse is caring for a client with hypertrophic cardiomyopathy. Based on this diagnosis, which class of medications does the nurse anticipate being prescribed?
A) Digoxin
B) Vasodilators
C) Nitrates
D) Beta blockers
Answer: D
Explanation: A) Digoxin is contraindicated for the client with hypertrophic cardiomyopathy.
B) Vasodilators are not used to treat hypertrophic cardiomyopathy.
C) Nitrates are not used to treat hypertrophic cardiomyopathy.
D) Beta blockers may be prescribed to relax the heart, stabilize the rhythm, and slow the heart's pumping action in clients with hypertrophic cardiomyopathy.
Page Ref: 1214
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe patient care. | Nursing Process: Planning
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

8) A client with cardiomyopathy receiving diuretic therapy has a urine output of 200 mL in 8 hours. Which action by the nurse is correct?
A) Assist the client to ambulate.
B) Document a normal urine output.
C) Notify the healthcare provider.
D) Measure abdominal girth.
Answer: C
Explanation: A) The nurse should not assist the client out of bed to ambulate at this time.
B) This is not a normal urine output.
C) The nurse should notify the healthcare provider, because a urine output of 200 mL in 8 hours is less than 30 mL per hour. The client could be dehydrated despite having peripheral edema.
D) Abdominal girth is not an objective measurement of fluid volume; daily weight is more precise.
Page Ref: 1217
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2 Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

9) A client diagnosed with cardiomyopathy asks the nurse to explain the different types of the disease. Which is inappropriate for the nurse to include in the teaching session?
A) Dilated cardiomyopathy
B) Restrictive cardiomyopathy
C) Hypotrophic cardiomyopathy
D) Arrythmogenic right ventricular dysplasia
Answer: C
Explanation: A) Dilated is a type of cardiomyopathy.
B) Restrictive is a type of cardiomyopathy.
C) Hypotrophic is not a type of cardiomyopathy.
D) Arrhythmogenic is a type of cardiomyopathy.
Page Ref: 1211
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation

Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Describe the pathophysiology of cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

10) A client with cardiomyopathy is having tachycardia. Which medication does the nurse anticipate being prescribed?
A) ACE Inhibitor
B) Angiotensin II receptor blocker
C) Beta blocker
D) Cardiac glycoside
Answer: C
Explanation: A) ACE inhibitors are used to decrease blood pressure in a client with cardiomyopathy.
B) Angiotensin II receptor blockers are used to decrease blood pressure in a client with cardiomyopathy.
C) A client with cardiomyopathy experiencing tachycardia may take a beta blocker to lower the heart rate.
D) Cardiac glycosides are used in congestive heart failure and do not assist in lowering the heart rate in a client with cardiomyopathy.
Page Ref: 1212
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

11) The nurse is caring for a client with cardiomyopathy who is experiencing activity intolerance. Which intervention is inappropriate for this problem?
A) Spacing out nursing activities so client fatigue is lessened
B) Assisting with client activities of daily living (ADLs) as necessary
C) Using passive and active range-of-motion (ROM) exercises as tolerated
D) Consulting with a physical therapist on an activity plan
Answer: A
Explanation: A) The nurse should cluster nursing activities, not space them out, in order to conserve client energy. This allows the client to rest between periods of nursing care.
B) The client who is experiencing activity intolerance should have assistance with ADLs.
C) The client who is experiencing activity intolerance should have ROM exercises.
D) The client who is experiencing activity intolerance should receive a physical therapy consult.
Page Ref: 1217
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

12) The nurse is educating a client with cardiomyopathy about diet choices that are appropriate for the client's condition. Which statement is inappropriate for the nurse to include in the teaching session?
A) "It is important to monitor your sodium intake."
B) "Increasing your dietary protein helps with cardiac cell repair."
C) "Here is a list of high-fat, high-cholesterol foods to avoid."
D) "I have notified the dietitian regarding your condition in order to provide you with more information."
Answer: B
Explanation: A) The nurse should instruct the client with cardiomyopathy to monitor sodium intake.
B) Instructing the client to increase protein is not appropriate and is not shown effective in managing cardiomyopathy.
C) The nurse should instruct the client with cardiomyopathy to avoid high-fat, high-cholesterol food.
D) Consulting with the dietitian is appropriate with this client.
Page Ref: 1217
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with cardiomyopathy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

13) A 14-year-old child was recently diagnosed with hypertrophic cardiomyopathy. During a follow-up appointment, the mother asks the nurse, "How will this affect my child's ability to play football in the fall?" In which way should the nurse respond?
A) "This shouldn't affect his ability to play football."
B) "Children with cardiomyopathy should not play football."
C) "He could participate in flag football but not tackle football."
D) "This may actually make him a better, stronger football player."
Answer: B
Explanation: A) The child should not play football.
B) Children with cardiomyopathy should not play competitive sports due to the possibility of collapse or increased heart failure.
C) Depending on the child's clinical status, low-impact activities may be appropriate, but this should be discussed with the child's physician.
D) The child will not be better or stronger if playing football.
Page Ref: 1215
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Differentiate care of patients with cardiomyopathy across the lifespan.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

14) A 72-year-old client diagnosed with hypertrophic cardiomyopathy (HCM) is speaking to the healthcare team about treatment options. Which treatment option would least likely be recommended for this client, even though it is commonly used to treat younger clients with this condition?
A) Defibrillator implantation
B) Beta-blocker administration
C) Calcium channel blocker administration
D) Physical activity restrictions
Answer: A
Explanation: A) The low morbidity and mortality rates among older clients do not support the use of the defibrillator devices frequently implanted in younger clients.
B) Treatment guidelines for older clients with HCM may include the use of beta blockers.
C) Treatment guidelines for older clients with HCM may include calcium channel blockers.
D) Treatment guidelines for older clients with HCM may include restrictions on physical activity.

Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.A. Analyze cardiomyopathy as it relates to perfusion. Differentiate care of patients with cardiomyopathy across the lifespan.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with cardiomyopathy.

Exemplar 16.B Congenital Heart Defects

1) The mother of a baby born with a congenital heart defect is upset, as no one else in the family has been born with this condition. To determine the cause of the defect, which question is appropriate for the nurse to ask the mother?
A) "Did you consume any alcohol before you knew you were pregnant?"
B) "Is there a history of diabetes in your family?"
C) "Was the baby's father exposed to any toxins in the work environment?"
D) "Do you have a history of hypertension?"
Answer: A
Explanation: A) Most congenital heart defects occur during the first 8 weeks of pregnancy and are a combination of environmental and genetic factors. Fetal exposure to alcohol is one of the greatest factors for the development of these defects. Asking the mother if she consumed alcohol before she was aware that she was pregnant is an appropriate question when determining the cause of the heart defect.
B) Maternal diabetes can impair fetal heart development, but a family history of diabetes is not known to cause congenital heart defects.
C) The father's exposure to toxins in the work environment is not known to cause congenital heart defects in children.
D) A history of hypertension will not cause a fetus to develop a congenital heart defect.
Page Ref: 1226
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Compare the risk factors and prevention of congenital heart defects.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

2) The nurse is analyzing data collected after assessing a child with a congenital heart defect that decreases pulmonary blood flow. Which problem would be applicable for this client?
A) Pain
B) Problems breathing
C) Decreased cardiac output
D) Overabundance of body fluid
Answer: C
Explanation: A) Pain is an appropriate problem for a child following cardiac surgery.
B) Problems breathing is a problem for a child following cardiac surgery.
C) A problem for a client with congenital heart defects that decrease pulmonary blood flow include decreased cardiac output.
D) Overabundance of body fluid is a problem in a client with a congenital heart defect that increases pulmonary blood flow.
Page Ref: 1234
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Diagnosis
Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with congenital heart defects.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

3) The nurse is planning care for a pediatric client recovering from surgery to repair a congenital heart defect. Which intervention should the nurse include to support the client's fluid status?
A) Encourage oral intake of fluids when permitted.
B) Limit oral and intravenous intake of fluids.
C) Continue normal saline administration even after oral intake is normal.
D) Convert the intravenous line to a saline lock immediately after surgery.
Answer: A
Explanation: A) The child should be encouraged to begin oral fluids and nutrition when permitted.
B) Although oral fluids are rarely limited, intake and output should be carefully assessed.
C) Fluids and antibiotics should be provided as ordered until the child's oral intake is normal.
D) Once normal, the line can be converted to a heparin or saline lock.
Page Ref: 1235
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with congenital heart defects.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

4) The nurse provides discharge instructions to the parents of a child recovering from surgery to repair a congenital heart defect. Which statement indicates that teaching has been effective?
A) "Our child should be restricted in play and activity for at least 6 months."
B) "Our child will need to take antibiotics prior to having dental surgery."
C) "Fluids should be restricted to maximize lung function."
D) "Our child should not return to normal activities for at least 2 years."
Answer: B
Explanation: A) The child should be encouraged to gradually return to normal activities, including play.
B) Since the child is at risk for infective endocarditis, prophylactic antibiotics are indicated for invasive procedures.
C) The child should not restrict fluids.
D) The child's activity should not be restricted for 6 months to 2 years.

Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with congenital heart defects.

WwW.TbSM.Ng

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

5) The nurse is caring for a premature infant diagnosed with patent ductus arteriosus (PDA). Which medication should the nurse anticipate administering to this client?

A) Indomethacin

B) Propranolol

C) Antibiotics

D) Prostaglandin E_1

Answer: A

Explanation: A) Intravenous indomethacin often stimulates the closure of the PDA in premature infants.

B) Propranolol is used to treat tetralogy of Fallot.

C) Prophylactic antibiotics are used in some clients with a congenital heart defect, but this is not common for infants with PDA.

D) Prostaglandin E_1 is used with some congenital heart defects to maintain a PDA, not help close the PDA.

Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a congenital heart defect.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

6) A baby will be having surgery to correct a congenital heart defect. On which topic should the parents be instructed regarding the care of the child before surgery?
A) Restricting immunizations until after the surgery
B) Preventing exposure to infection
C) Implementing no particular precautions
D) Restricting fluids for a week before the surgery
Answer: B
Explanation: A) Immunizations should be continued.
B) Preoperative care of a baby having surgery to correct a congenital heart defect should include prevention from infection with good hand washing.
C) There are precautions that the parents should take to ensure the child is in optimal health prior to the surgery.
D) The parents may be instructed to withhold food and fluids several hours before the surgery. Fluids would not be restricted for a week before surgery.

Client Need/Sub: Safe and Effective Care Environment: Safety and Infection Control
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with congenital heart defects.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

7) The nurse is assessing a toddler diagnosed with tetralogy of Fallot (TOF). Which clinical manifestations does the nurse anticipate during the physical assessment? **Select all that apply.**
A) Palpable thrill in the pulmonic area
B) Nail clubbing
C) Cough
D) Apneic periods
E) Knee-chest position
Answer: A, B, E
Explanation: A) Manifestations of TOF include a palpable thrill in the pulmonic area.
B) Manifestations of TOF include clubbing of the fingers due to reduce oxygenation.
C) A cough is not a manifestation of this congenital heart defect.
D) Apneic periods are not manifestations of this congenital heart defect.
E) Manifestations of TOF include the knee-chest position, which the child will perform to decrease the return of systemic venous blood to the heart.

Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Identify the clinical manifestations of congenital heart defects.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

8) Which best describes how congenital defects are categorized?
A) By the severity of defect
B) By the pathophysiology and hemodynamics of defect
C) By the location of defect
D) By the infant's age when the defect was diagnosed
Answer: B
Explanation: A) Congenital heart defects are not categorized by the severity of the defect.
B) Congenital heart defects are categorized by their pathophysiology and hemodynamics.
C) Congenital heart defects are not categorized by the location of the defect.
D) Congenital heart defects are not categorized by the infant's age when the defect is diagnosed.

Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Describe the pathophysiology of congenital heart defects.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

9) The nurse is caring for a child with an atrial septal defect (ASD). Which manifestations would the nurse expect upon assessment? **Select all that apply.**

A) Pulmonary artery hypotension
B) Midsystolic murmur at lower right sternal border
C) Mitral valve regurgitation with cleft on mitral valve
D) S_1 heart tone may be split due to forceful left ventricular contraction
E) Congestive heart failure

Answer: C, E

Explanation: A) Pulmonary artery hypertension is seen in ASD.
B) The midsystolic murmur can be heard at the lower left sternal border.
C) Mitral valve regurgitation may occur with a cleft on the mitral valve.
D) S_1 heart tones may be split due to forceful right ventricular contraction.
E) Congestive heart failure may occur.

Page Ref: 1219

Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Identify the clinical manifestations of congenital heart defects.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

10) The nurse is providing teaching to the parents of a child born with tetralogy of Fallot (TOF). Which statement should the nurse include in her teaching regarding this defect?

A) "Increased pulmonary blood flow causes symptoms with this disease."

B) "This disease consists of pulmonic stenosis, left ventricular hypertrophy, ventricular septal defect, and an overriding aorta."

C) "Your child has a decreased amount of red blood cells because of this disease."

D) "This disease consists of pulmonic stenosis, right ventricular hypertrophy, ventricular septal defect, and an overriding aorta."

Answer: D

Explanation: A) TOF is characterized by decreased pulmonary blood flow.

B) TOF consists of four defects–pulmonic stenosis, right ventricular hypertrophy, ventricular septal defect, and an overriding aorta.

C) TOF is characterized by polycythemia (increased red blood cells due to hypoxia).

D) TOF consists of four defects–pulmonic stenosis, right ventricular hypertrophy, ventricular septal defect, and an overriding aorta.

Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Identify the clinical manifestations of congenital heart defects.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

11) The nurse is caring for an infant diagnosed with hypoplastic left heart syndrome. The client has recently been scheduled for surgery to repair the defect. Which procedure does the nurse anticipate needing to provide client teaching about to the client's family?
A) Norwood procedure
B) Jatene procedure
C) Rastelli procedure
D) Damus-Kaye-Stansel procedure
Answer: A
Explanation: A) Hypoplastic left heart syndrome is repaired using the Norwood, Glenn, and Fontan procedures, depending on the child's age.
B) The Jatene procedure surgically repairs the Transposition of Great Arteries (TGA).
C) The Rastelli procedure is used to repair TGA with ventricular septal defect and pulmonary stenosis.
D) The Damus-Kaye-Stansel procedure surgically repairs the Transposition of Great Arteries (TGA).

12) During what period of gestation do congenital heart defects usually develop?
A) First 8 weeks of gestation
B) Second trimester
C) Third trimester
D) Last 4 weeks of gestation
Answer: A
Explanation: A) Most congenital heart defects develop during the first 8 weeks of gestation.
B) Most congenital heart defects do not develop during the second trimester.
C) Most congenital heart defects do not develop during the third trimester.
D) Most congenital heart defects do not develop during the last 4 weeks of gestation.

Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Describe the etiology of congenital heart defects.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

13) The nurse is caring for a pregnant woman with congenital heart disease. The woman asks if she will be able to have a vaginal delivery. Which answer by the nurse is correct?
A) A cesarean section is preferred because you will lose less blood than with a vaginal birth.
B) A cesarean section is preferred because there is a lower risk of infection than with a vaginal birth.
C) A vaginal birth is preferred over a cesarean section for women who have aortic stenosis.
D) A vaginal birth is preferred because there is a lower risk of thrombophlebitis than with a Cesarean section.
Answer: A
Explanation: A) Vaginal delivery is preferable to cesarean section for most clients with congenital heart defects because they will likely lose less blood with vaginal birth.
B) Risk of wound infection is a concern with cesarean birth.
C) A vaginal delivery is contraindicated in aortic stenosis.
D) Thrombophlebitis is a concern with cesarean birth.

Learning Outcome: 16.B. Analyze congenital heart defects as they relate to perfusion. Differentiate care of patients with congenital heart defects across the lifespan.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

14) The nurse is caring for an adult client who was diagnosed with a congenital heart defect as a child, which was later repaired with surgery. Which common complication of a heart defect should the nurse monitor that the client may still be at risk for?
A) Deep vein thrombosis
B) Endocarditis
C) Atherosclerosis
D) Shock
Answer: B
Explanation: A) Congenital heart defects do not normally cause deep vein thrombosis.
B) Common complications of congenital heart defects that develop during adulthood include dysrhythmias, endocarditis, stroke, heart failure, pulmonary hypertension, and heart valve problems.
C) Congenital heart defects do not normally cause atherosclerosis.
D) Congenital heart defects do not normally cause shock.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with congenital heart defects.

Exemplar 16.C Coronary Artery Disease

1) The nurse is documenting assessment findings on a client with angina. Which term should the nurse use to describe chest pain that occurs at night and is unrelated to activity?
A) Nonanginal pain
B) Prinzmetal angina
C) Unstable angina
D) Stable angina
Answer: B
Explanation: A) The client has been diagnosed with angina, and, therefore, the chest pain the client is experiencing is likely angina, not non-anginal pain.
B) Prinzmetal (variant) angina is unrelated to activity and often occurs at night.
C) Unstable angina occurs with increasing frequency, severity, and duration. The pain is unpredictable.
D) Stable angina is induced by exercise and is relieved by rest or nitroglycerin.
Page Ref: 1240
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Describe the pathophysiology of CAD.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

2) The nurse is caring for a client who has had a myocardial infarction. The client states, "I have been smoking for 35 years, what good will quitting do?" Which response is best?
A) "Your risk of continued coronary artery disease will decrease by half when you stop."
B) "Quitting will enhance the effects of your medications."
C) "Your medications will not work if you smoke."
D) "Quitting will ensure you don't develop any complications."
Answer: A
Explanation: A) Smoking cessation reduces the risk for coronary heart disease by 50% no matter how long the person has smoked.
B) Smoking cessation will possibly enhance medication effects, but the primary focus for this client is the effect on coronary artery disease.
C) Smoking cessation will possibly enhance medication effects.
D) Smoking cessation will reduce the possibility of complications, but the primary focus for this client is the effect on coronary artery disease.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Compare the risk factors and prevention of CAD.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

3) The nurse is preparing preoperative teaching for a client scheduled for a ventricular assist device (VAD). Which should the nurse include in these instructions?
A) Need to stay on bedrest for a week or more
B) Cardiac pain postoperatively is to be expected
C) Risk for postoperative infection
D) Expect to be ambulating the evening of surgery
Answer: C
Explanation: A) The client may or may not be on bedrest for a week or more after the surgery.
B) Cardiac pain postoperatively is not to be expected and could indicate a myocardial infarction.
C) Clients with VAD are at considerable risk for infection; strict aseptic technique is used with all invasive catheters and dressing changes.
D) The client will most likely not be ambulating the evening of the surgery.

Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with CAD.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

4) The nurse is instructing an older adult client about atorvastatin (Lipitor) to treat elevated cholesterol. Which side effects should the nurse advise the client to report to the healthcare provider?
A) Headaches and nausea
B) Muscle pain and weakness
C) Bruising and excessive bleeding
D) Shortness of breath and coughing
Answer: B
Explanation: A) Headaches are not common side effects that need to be reported to the physician.
B) Clients taking statins, such as atorvastatin (Lipitor), should promptly report muscle pain, tenderness, or weakness; skin rash, hives, or changes in skin color; and abdominal pain, nausea, or vomiting.
C) Bruising or bleeding are not common side effects that need to be reported to the physician.
D) Shortness of breath or coughing are not common side effects that need to be reported to the physician.

Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with CAD.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

5) The nurse is providing care to a client who has experienced several episodes of angina. Which prescription does the nurse anticipate to reduce the intensity and frequency of an angina episode?
A) Therapeutic lifestyle changes
B) Statin therapy
C) Nitrate therapy
D) Anticoagulant therapy
Answer: C
Explanation: A) Therapeutic lifestyle changes are significant if the client is to maintain a healthy heart.
B) Statins are used to decrease cholesterol levels.
C) A primary goal in the treatment of angina is to reduce the intensity and frequency of angina episodes. Rapid-acting organic nitrates are the drugs of choice for terminating an acute angina episode.
D) Anticoagulant therapy is used to prevent additional thrombi from forming post-myocardial infarction.
Page Ref: 1240

Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with CAD.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

6) A client recovering from an acute myocardial infarction is prescribed aspirin. Which teaching points should the nurse include regarding this prescription? **Select all that apply.**
A) Report any itching after seven days of taking.
B) Check with your healthcare provider before taking herbal remedies.
C) Take at a different time of day than warfarin.
D) Report bleeding or bruising to the healthcare provider.
E) Do not skip any scheduled appointments to have blood drawn for labs.
Answer: B, D
Explanation: A) Itching is not a common side effect of aspirin therapy.
B) Herbal remedies such as evening primrose oil, garlic, gingko biloba, or grapeseed extract can increase the effect of the aspirin.
C) Aspirin and Coumadin are not to be taken concurrently.
D) Bleeding and bruising can occur and should be reported to the healthcare provider.
E) Aspirin inhibits platelet aggregation and clot formation. No lab appointments will be made just for aspirin therapy.

Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with CAD.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

WwW.TeSm.Ws

7) A client with angina is experiencing acute chest pain. The client rates the pain as a 7 out of 10. The client's vital signs include P 119, R 24, BP 98/63, T 99.1°F, and SpO_2 89%. Which actions would the nurse implement at this time? **Select all that apply.**
A) Administer antianxiety medication as prescribed.
B) Coach in nonpharmacologic pain management techniques.
C) Implement bedrest.
D) Administer morphine sulfate 2 mg intravenous push as prescribed.
E) Administer oxygen at 2 liters/minute via nasal cannula as prescribed.
Answer: C, D, E
Explanation: A) Antianxiety medications are not effective in acute chest pain.
B) Nonpharmacologic pain management techniques are not appropriate for an episode of acute chest pain.
C) Interventions for the client experiencing acute chest pain include keeping the client on bedrest.
D) Interventions for the client experiencing acute chest pain include administering morphine sulfate as prescribed.
E) Interventions for the client experiencing acute chest pain include administering oxygen as prescribed.
Page Ref: 60
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with CAD.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

WwW.TeSM.Ws

8) The nurse is teaching a client about the different types of angina. Which client statement indicates the need for follow up teaching?
A) "Stable angina is the most common form of angina."
B) "Prinzmetal angina is atypical angina that occurs with strenuous exercise."
C) "Unstable angina occurs with increasing frequency, severity, and duration."
D) "Clients with unstable angina are at risk for a heart attack."
Answer: B
Explanation: A) Stable angina is the most common form of angina and is relieved with rest and nitrate medications.
B) Prinzmetal angina is atypical angina that is unrelated to activity.
C) Unstable angina occurs with increasing frequency, severity, and duration.
D) Clients with unstable angina are at risk for a heart attack, or myocardial infarction.
Page Ref: 1240
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Evaluation
Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Describe the pathophysiology of CAD.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

9) The nurse is providing care to a female client who is diagnosed with coronary artery disease. The client states to the nurse, "I don't know how this happened." Which response by the nurse is the most appropriate?

A) "Women who take oral contraceptives are more likely to develop this disease."
B) "Women who have children later in life often develop this disease"
C) "Women with a history of sexually transmitted infections are more likely to develop this disease."
D) "Women who conceive through the use of in-vitro fertilization are more likely to develop this disease."

Answer: A

Explanation: A) Risk factors for coronary artery disease that are unique to women include premature menopause, oral contraceptive use, and hormone replacement therapy (HRT).
B) Having children later in life does not increase the risk of coronary artery disease for women.
C) A history of sexually transmitted infections does not increase the risk of coronary artery disease for women.
D) The use of in-vitro fertilization does not increase the risk of coronary artery disease for women.

Page Ref: 1244
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Relationship Centered Care: Factors that contribute to or threaten health. | Nursing Process: Implementation
Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Differentiate care of patients with CAD across the lifespan.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

10) The nurse is teaching a client about the associated health risks of cocaine use. Which statement should the nurse use to describe how cocaine can cause myocardial infarction (MI)?
A) Cocaine significantly increases the serum triglyceride level, leading to the development of an atheroma.
B) Cocaine alters the body's clotting mechanisms, leading to thrombus formation.
C) Cocaine increases sympathetic nervous system stimulation, increasing blood pressure and vasoconstriction.
D) Cocaine alters electrolyte balance, leading to arrhythmias.
Answer: C
Explanation: A) Cocaine does not increase serum triglyceride levels.
B) Cocaine does not alter the clotting mechanisms.
C) Acute MI may also develop as a result of cocaine intoxication. Cocaine increases sympathetic nervous system activity by both increasing the release of catecholamines from central and peripheral stores and interfering with the reuptake of catecholamines. This increased catecholamine concentration stimulates the heart rate and increases its contractility, increases the automaticity of cardiac tissues and the risk of dysrhythmias, and causes vasoconstriction and hypertension.
D) Cocaine does not alter electrolyte balance.
Page Ref: 1242
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Describe the pathophysiology of CAD.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

11) A community health nurse is providing education to a group of adults regarding myocardial infarction (MI). When discussing ways to prevent the number of MI-related deaths, which statement by the nurse is inappropriate?
A) "It is important to learn how to perform cardiopulmonary resuscitation (CPR)."
B) "Be sure to take a baby aspirin every day to help prevent an MI."
C) "Increase your knowledge of the manifestations of MI."
D) "Seek immediate medical attention when you suspect an MI."
Answer: B
Explanation: A) Learning CPR is appropriate.
B) Instructing all clients to take a baby aspirin every day to help prevent an MI is inappropriate, as not all clients should take this medication.
C) Learning about the manifestations of MI is appropriate.
D) Clients should be taught to seek immediate medical attention when they suspect an MI.
Page Ref: 1259
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Compare the risk factors and prevention of CAD.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

12) Which finding is the most common clinical manifestation of coronary artery disease?
A) Chest pain
B) Dyspnea
C) Irritability
D) Tachycardia
Answer: A
Explanation: A) Coronary artery disease is often asymptomatic. When clinical manifestations do occur, the most common indications are angina and myocardial infarction. Angina, acute coronary syndrome, and acute myocardial infarction are all characterized by the presence of chest pain of various intensities.
B) Dyspnea may be present in some clients, chest pain is the classical manifestation of coronary artery disease.
C) Irritability may be present in some clients, chest pain is the classical manifestation of coronary artery disease.
D) Tachycardia may be present in some clients, chest pain is the classical manifestation of coronary artery disease.

Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Identify the clinical manifestations of CAD.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

WwW. TeSt. Ws

13) For a client with coronary artery disease, which action can the nurse recommend to the client to help decrease cardiac workload and sympathetic nervous system stimulation?
A) Physical rest
B) Psychological rest
C) Fluid intake
D) Fluid restriction
Answer: A
Explanation: A) For the client with coronary artery disease, physical rest helps decrease cardiac workload and sympathetic nervous system stimulation, promoting comfort.
B) Information and emotional support help decrease anxiety and promote psychological rest.
C) Fluid overload may increase cardiac workload.
D) The nurse should not restrict fluids unless prescribed by the physician.
Page Ref: 1255
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.C. Analyze coronary artery disease (CAD) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with CAD.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

14) The nurse is caring for a 76-year-old client with a history of angina. Which atypical age-related warning sign of a myocardial infarction should the nurse need to include in client teaching?
A) Cool, clammy skin
B) Chest pain
C) Tachycardia
D) Abdominal pain
Answer: D
Explanation: A) Cool, clammy skin is a symptom of myocardial infarction that is more common in younger individuals but less common in older individuals.
B) Chest pain is a symptom of myocardial infarction that is more common in younger individuals but less common in older individuals.
C) Tachycardia is a symptom of myocardial infarction that is more common in younger individuals but less common in older individuals.
D) Older adults commonly have atypical symptoms of myocardial infarction, such as difficulty breathing, confusion, fainting, dizziness, abdominal pain, or cough.
Page Ref: 1258

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with coronary artery disease.

Exemplar 16.D Deep Venous Thrombosis

1) The nurse is completing an assessment on a newly admitted client. Which finding would indicate to the nurse that the client may be experiencing a deep venous thrombosis (DVT)?
A) Shortness of breath after activity
B) Two-plus palpable pedal pulses
C) Swelling in one leg with edema
D) Sharp pain in both legs
Answer: C
Explanation: A) Shortness of breath that subsides after activity is not a manifestation of DVT.
B) Two-plus palpable pulses are not manifestations of DVT.
C) Manifestations of DVT include swelling in one leg with pitting edema because the clot is obstructing the venous return from the leg.
D) Pain in the affected extremity is usually dull and aching, not sharp.
Page Ref: 1266
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.D. Analyze deep venous thrombosis (DVT) as it relates to perfusion. Identify the clinical manifestations of DVT.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

2) The nurse is planning care for a group of clients. Which client should the nurse identify as having the greatest risk for developing deep venous thrombosis (DVT)?
A) The client recovering from laparoscopic gallbladder surgery
B) The client admitted with new-onset type 2 diabetes
C) The client admitted with community-acquired pneumonia
D) The client recovering from knee replacement surgery
Answer: D
Explanation: A) The client recovering from laparoscopic gallbladder surgery would be at a lower risk for DVT because prolonged immobility will not occur.
B) The client admitted with new-onset type 2 diabetes would be at a lower risk for DVT because prolonged immobility will not occur.
C) The client admitted with community-acquired pneumonia would be at a lower risk for DVT because prolonged immobility will not occur.
D) Up to 80% of clients with an orthopedic procedure will develop a DVT if no prophylaxis is provided.
Page Ref: 1266
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.D. Analyze deep venous thrombosis (DVT) as it relates to perfusion. Compare the risk factors and prevention of DVT.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

3) A client recovering from a cesarean section and breastfeeding is diagnosed with superficial venous thrombosis. Which intervention should the nurse anticipate carrying out first?
A) Encourage to ambulate freely
B) Aspirin 650 mg every 4 hours
C) Apply warm, moist compresses
D) Provide methylergonovine (Methergine) IM
Answer: C
Explanation: A) Ambulation would increase the inflammation.
B) Heparin or warfarin is preferred over aspirin for treatment of venous thrombosis, and both are safe for lactating mothers.
C) The treatment for superficial venous thrombosis involves resting the extremity, administering anti-inflammatory agents, and applying warm, moist compresses over the affected vein.
D) Methylergonovine is given only for postpartum hemorrhage and would cause vasoconstriction of an already inflamed vessel.
Page Ref: 1271
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.D. Analyze deep venous thrombosis (DVT) as it relates to perfusion. Differentiate care of patients with DVT across the lifespan.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

4) The nurse is planning care for a client with deep venous thrombosis (DVT). Which problem would be a priority for this client?
A) Infection
B) Fluid volume
C) Peripheral perfusion
D) Sleep pattern
Answer: C
Explanation: A) Infection would be a priority if complications of infection were present; however, this is not the case.
B) Fluid volume is not related to the underlying cause.
C) A problem with peripheral tissue perfusion is the priority, because it is related to obstructed venous return, which is the underlying cause of the DVT.
D) Sleep pattern is not related to the underlying cause.
Page Ref: 1272
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Diagnosis
Learning Outcome: 16.D. Analyze deep venous thrombosis (DVT) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with DVT.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

5) The nurse is providing discharge teaching to a client recovering from deep venous thrombosis (DVT). Which instructions are appropriate for the nurse to include in the teaching session?

Select all that apply.

A) Avoid crossing the legs
B) Avoid long car trips
C) Avoid prolonged standing or sitting
D) Take frequent walks
E) Take a daily aspirin dose of 650 mg

Answer: A, C, D

Explanation: A) The client should be instructed to avoid crossing the legs because it increases pressure on the veins of the lower extremities.

B) The client does not need to be instructed to avoid long car trips but rather to take frequent breaks during long car trips.

C) The client should be instructed to avoid prolonged standing or sitting, which contributes to venous stasis.

D) The client should be instructed to take frequent walks to promote venous return.

E) The client should not be instructed to take a daily aspirin, because it will increase anticoagulant activity and could interact with other medication prescribed for the treatment of the DVT.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.2 Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation

WwW.TeSm.Ws

Learning Outcome: 16.D. Analyze deep venous thrombosis (DVT) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with DVT.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

6) A client diagnosed with a deep vein thrombosis (DVT) is receiving intravenous heparin. Which is the priority outcome for this client?
A) The client will not disturb the intravenous infusion.
B) The client will comply with dietary restrictions.
C) The client will not experience bleeding.
D) The client will keep the right leg elevated on two pillows.
Answer: C
Explanation: A) Disturbing the intravenous line could relate to bleeding, but this does not directly correlate with heparin.
B) Dietary restrictions are important, but not as high a priority as an absence of bleeding.
C) An absence of bleeding is a priority outcome for any client receiving anticoagulant therapy.
D) Elevation of the affected extremity is important, but not as high a priority as an absence of bleeding.
Page Ref: 1272
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.D. Analyze deep venous thrombosis (DVT) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with DVT.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

7) A client receiving heparin therapy for deep venous thrombosis (DVT) complains of severe chest pain and shortness of breath. Suspecting a pulmonary embolism, which is the priority action by the nurse?
A) Assess pulse, respirations, and blood pressure.
B) Apply oxygen and elevate the head of the bed.
C) Reassure the client and notify family members.
D) Increase the rate of heparin infusion.
Answer: B
Explanation: A) Assessing pulse, respiration, and blood pressure will be performed following the initiation of oxygen therapy and bed elevation.
B) Applying oxygen and elevating the head of the bed will promote ventilation and gas exchange in those alveoli that are well perfused, helping to maintain tissue oxygenation.
C) Although reassuring the client and notifying family members are important, they are not a higher priority than promoting oxygenation.
D) Increasing the rate of heparin infusion cannot be done by the nurse without an order from a healthcare provider.
Page Ref: 1273

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

8) A client being treated for deep venous thrombosis (DVT) is experiencing pain. Which interventions should the nurse implement? **Select all that apply.**
A) Place an egg-crate mattress on the bed.
B) Maintain bedrest as ordered.
C) Apply warm, moist heat to the area four times a day.
D) Encourage position changes every 2 hours.
E) Measure calf and thigh diameter daily.
Answer: B, C, E
Explanation: A) Placing an egg-crate mattress on the bed would be appropriate for the client experiencing problems with peripheral tissue perfusion.
B) Interventions to address pain include maintaining bedrest as ordered.
C) Interventions to address pain include applying warm, moist heat to the area four times a day.
D) Encouraging position changes every 2 hours would be appropriate for the client experiencing problems with peripheral tissue perfusion.
E) Interventions to address pain include measuring calf and thigh diameter daily.

Learning Outcome: 16.D. Analyze deep venous thrombosis (DVT) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with DVT.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

9) Which term will the nurse use that describes the three pathological factors that are associated with the formation of a thrombus?
A) Rastelli syndrome
B) Holter triad
C) Vena cava syndrome
D) Virchow's triad
Answer: D
Explanation: A) The Rastelli procedure is used to repair some congenital heart defects.
B) A Holter monitor is used to record the electrical activity of the heart over 24 to 48 hours.
C) A vena cava filter is used to prevent thrombi from traveling up to the heart from the legs.
D) Three pathological factors, called Virchow's triad, are associated with the formation of a thrombus: circulatory stasis, vascular damage, and hypercoagulability.
Page Ref: 1265

Learning Outcome: 16.D. Analyze deep venous thrombosis (DVT) as it relates to perfusion. Describe the pathophysiology of DVT.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

10) Which characteristic of veins increases the risk for the development of a thrombus?
A) Low blood flow
B) High pressure
C) Retrograde blood flow
D) Presence of plaque
Answer: A
Explanation: A) Venous thrombi tend to occur at sites where the vein is normal but blood flow is low.
B) High pressure in the veins does not stimulate the formation of a thrombus.
C) Retrograde blood flow is associated with postthrombotic syndrome, which occurs after a deep vein thrombosis has already developed.
D) Arterial thrombi tend to occur at sites of arterial plaque rupture.

Learning Outcome: 16.D. Analyze deep venous thrombosis (DVT) as it relates to perfusion. Describe the etiology of DVT.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

11) Which diagnostic test is invasive and used to assess and diagnose venous thrombosis?
A) Venography
B) Duplex venous ultrasonography
C) Magnetic resonance imaging
D) Plethysmography
Answer: A
Explanation: A) Venography is the only invasive test.
B) Duplex venous ultrasonography is a noninvasive test using sound waves to provide vein visualization.
C) MRI uses strong magnetic fields to generate images of structures within the body.
D) Plethysmography is a noninvasive test that measures blood flow as it moves through the veins.
Page Ref: 1266

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

12) Both a 40-year-old male and a 70-year-old male are placed on anticoagulant therapy after diagnosis of a deep vein thrombosis (DVT). When providing teaching to these clients about their medication, in which way should the nurse individualize care for each?
A) The younger client will need more frequent monitoring than the older client.
B) The older client will need more frequent monitoring than the younger client.
C) The older client will take a lower dose than the younger client.
D) The younger client will take a lower dose than the older client.
Answer: B
Explanation: A) The younger client will not need more frequent monitoring.
B) Anticoagulant therapy is commonly used to treat both older and younger adults with DVT. Most drugs are administered in a similar fashion and at comparable doses in older and younger clients, but monitoring may occur more frequently in older adults.
C) The dose is not contingent upon the client's age.
D) The dose is not contingent upon the client's age.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with deep vein thrombosis.

Exemplar 16.E Disseminated Intravascular Coagulation

1) A client is admitted to the intensive care unit with disseminated intravascular coagulation (DIC). Which clinical manifestations does the nurse anticipate? Select all that apply.
A) Tachycardia
B) Increased blood glucose level
C) Decreased breath sounds
D) Confusion
E) Thick, tenacious bronchial secretions
Answer: A, C, D
Explanation: A) Clinical manifestations of DIC include tachycardia.
B) Increased blood glucose is not associated with this health problem.
C) Clinical manifestations of DIC include decreased breath sounds.
D) Clinical manifestations of DIC include confusion.
E) Thick bronchial secretions are not associated with this health problem.

Learning Outcome: 16.E. Analyze disseminated intravascular coagulation (DIC) as it relates to perfusion. Identify the clinical manifestations of DIC.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

2) The nurse is caring for a client who has been admitted to labor and delivery. Which risk factors for disseminating intravascular coagulation (DIC) should the nurse identify for this client? **Select all that apply.**

A) Multiparity

B) Placental abruption

C) Preterm labor

D) Prior fetal death

E) Gestational diabetes

Answer: B, D

Explanation: A) Multiparity does not cause DIC.

B) The risk of developing DIC increases in pregnant women who have placental abruption.

C) Preterm labor does not cause DIC.

D) The risk of developing DIC increases in pregnant women who have had fetal death.

E) Gestational diabetes does not cause DIC.

Page Ref: 1278

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment

Learning Outcome: 16.D. Analyze disseminated intravascular coagulation (DIC) as it relates to perfusion. Differentiate care of patients with DIC across the lifespan.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

3) The nurse is caring for a client with disseminated intravascular coagulation (DIC). Which should the nurse identify as a priority intervention for this client?
A) Frequent ambulation
B) Maintenance of skin integrity
C) Preparation for radiograph procedures
D) Restricting fluids
Answer: B
Explanation: A) The client with DIC should be placed on bedrest.
B) Impairment of skin integrity can lead to bleeding in DIC.
C) DIC is not diagnosed with radiograph examination but by serum lab studies.
D) Fluids need to be monitored but will not be restricted.
Page Ref: 1279
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.E. Analyze disseminated intravascular coagulation (DIC) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with DIC.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

4) A client with disseminated intravascular coagulation (DIC) is anxious and has decreased oxygen saturation. Which is the priority problem for this client?
A) Acute pain
B) Inadequate gas exchange
C) Impaired peripheral tissue perfusion
D) Fear
Answer: B
Explanation: A) Decreased oxygen saturation and anxiety would not be addressed with the problem of acute pain.
B) The decrease in oxygen saturation is a result of impairment in the client's gas exchange.
C) Decreased oxygen saturation and anxiety would not be addressed with the problem of impaired peripheral tissue perfusion.
D) Fear could contribute to the client's impaired gas exchange but is not the primary problem to address.
Page Ref: 1279
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Diagnosis
Learning Outcome: 16.E.7. Analyze disseminated intravascular coagulation (DIC) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with DIC.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

5) The nurse has identified the problem of impaired peripheral tissue perfusion for a client with disseminated intravascular coagulation (DIC). Which intervention would be appropriate for the client?

A) Carefully repositioning the client every 2 hours
B) Administering oxygen
C) Monitoring oxygen saturation
D) Encouraging deep breathing and coughing

Answer: A

Explanation: A) The intervention appropriate for the client experiencing impaired peripheral tissue perfusion is to carefully reposition the client every 2 hours because position changes facilitate circulation and tissue perfusion.

B) Administering oxygen would be appropriate if the client were experiencing impaired gas exchange.

C) Monitoring oxygen saturation would be appropriate if the client were experiencing impaired gas exchange.

D) Deep breathing and coughing would be appropriate if the client were experiencing impaired gas exchange.

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning

Learning Outcome: 16.E. Analyze disseminated intravascular coagulation (DIC) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with DIC.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

6) The nurse is evaluating care provided to a client with disseminated intravascular coagulation (DIC). Which finding indicates care has been successful for this client?
A) Heart rate 110 beats per minute
B) Oxygen saturation level 86%
C) Urine output 20 mL per hour
D) No evidence of bleeding
Answer: D
Explanation: A) Heart rate of 110 beats per minute would indicate the need for further treatment.
B) Oxygen saturation of 86% would indicate the need for further treatment.
C) Urine output of 20 mL per hour would indicate the need for further treatment.
D) Care provided to a client with DIC is successful when there is no further bleeding.
Page Ref: 1280

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Evaluation
Learning Outcome: 16.E. Analyze disseminated intravascular coagulation (DIC) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with DIC.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

7) A client with disseminated intravascular coagulation (DIC) is currently bleeding through the gastrointestinal tract. Which medication does the nurse anticipate administering to this client as a first line treatment?
A) Aspirin
B) Warfarin
C) Fresh frozen plasma and platelets
D) Heparin
Answer: C
Explanation: A) Aspirin and is not indicated in the treatment of DIC.
B) Warfarin is not indicated in the treatment of DIC.
C) When bleeding is the major manifestation of DIC, fresh frozen plasma and platelet concentrates are given to restore clotting factors and platelets.
D) Heparin may be administered if bleeding is not controlled by plasma and platelets and if the client has manifestations of thrombotic problems.

Learning Outcome: 16.E. Analyze disseminated intravascular coagulation (DIC) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with DIC.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

8) A client with disseminated intravascular coagulation (DIC) is experiencing joint pain. Which nursing intervention is appropriate for this client?
A) Splints
B) Cool compresses
C) Heat
D) Ice
Answer: B
Explanation: A) Splints may hinder joint mobility and are not indicated for the care of this client.
B) Joint pain associated with DIC can be reduced by applying cool compresses to the affected joints to reduce the transmission of pain impulses.
C) Heat will encourage bleeding and should not be applied to this client.
D) Ice should not be applied but rather cool compresses.
Page Ref: 1279
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.E. Analyze disseminated intravascular coagulation (DIC) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with DIC.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

10) The nurse is assessing a client during labor and delivery. Which condition should the nurse recognize as a risk factor for disseminated intravascular coagulation (DIC)?
A) Gestational diabetes
B) Polyhydramnios
C) Placental abruption
D) Placenta previa
Answer: C
Explanation: A) Gestational diabetes is not a risk factor for DIC.
B) Polyhydramnios is not a risk factor for DIC.
C) Acute DIC can occur in pregnant clients, most often with pregnancies complicated by preeclampsia, placental abruption, fetal demise, amniotic fluid embolism, and septic abortion.
D) Placenta previa is not a risk factor for DIC.
Page Ref: 1278

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.E. Analyze disseminated intravascular coagulation (DIC) as it relates to perfusion. Differentiate care of patients with DIC across the lifespan.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

11) A client with disseminated intravascular coagulation (DIC) has the problem of impaired peripheral tissue perfusion. Which actions are appropriate for this problem? **Select all that apply.**

A) Monitor the client's level of consciousness and mental status.
B) Elevate the client's knees on the bed or with a pillow.
C) Minimize the use of tape on the client's skin.
D) Assess extremity pulses, warmth, and capillary refill.
E) Carefully reposition the client at least every 2 hours.

Answer: A, C, D, E

Explanation: A) The nurse should monitor the client's level of consciousness and mental status due to the risk of cerebral emboli.

B) The nurse should not elevate the client's knees on the bed or with a pillow because this may impair arterial and venous flow to the lower legs and feet, increasing vascular stasis and the risk for thrombosis.

C) Preventing skin trauma reduces the risk for bleeding.

D) The nurse will assess extremity pulses, warmth, and capillary refill, which facilitates the early treatment of impaired perfusion.

E) Position changes facilitate circulation and tissue perfusion and provide an opportunity to assess for purpura, pallor, and bleeding.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

12) A client with disseminated intravascular coagulation (DIC) has the problem of inadequate gas exchange. Which action is appropriate when providing care based on this problem?
A) Place the client in the Fowler position
B) Monitor the client's oxygen saturation intermittently
C) Encourage frequent ambulation
D) Use continuous endotracheal suctioning instead of coughing and deep breathing
Answer: A
Explanation: A) Micro clots in the pulmonary vasculature are likely to interfere with gas exchange in the client with DIC. The nurse should place the client in Fowler or high-Fowler position to improve gas exchange.
B) Oxygen saturation levels are a noninvasive means of assessing gas exchange and should be monitored continuously.
C) The client must remain on bedrest to reduce oxygen demands and cardiac workload.
D) Cautious nasotracheal suctioning is indicated only if cough is ineffective or an endotracheal tube is in place. Deep breathing increases respiratory depth and improves alveolar ventilation and oxygenation.

WWW.TBSM.US

13) Which pathological change related to disseminated intravascular coagulation (DIC) occurs late in the course of the disease?
A) Hemorrhage
B) Formation of small clots
C) Damage to the endothelium
D) Brain ischemia
Answer: A
Explanation: A) When clotting factors are depleted and fibrin degradation products are released, hemorrhage occurs.
B) The presence of thrombin causes small clots to form in the microvasculature.
C) Damage to the endothelium is one of the triggers that stimulates the clotting cascade.
D) If thrombi and emboli impair tissue perfusion, ischemia of organs such as the brain can occur.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with disseminated intravascular coagulation.

Exemplar 16.F Heart Failure

1) The nurse is caring for a client with congestive heart failure (CHF) who frequently wakes during the night frightened and short of breath. Which condition is the client experiencing?
A) Cardiomyopathy
B) Paroxysmal nocturnal dyspnea
C) High-output failure
D) Multisystem heart failure
Answer: B
Explanation: A) The client is not experiencing cardiomyopathy.
B) Paroxysmal nocturnal dyspnea occurs when edema fluid that has accumulated during the day is reabsorbed into the circulation at night. This causes fluid overload and pulmonary congestion. The client awakens at night short of breath and frightened.
C) The client is not experiencing high-output failure.
D) The client is not experiencing multisystem heart failure.
Page Ref: 1285

Learning Outcome: 16.F. Analyze heart failure (HF) as it relates to perfusion. Identify the clinical manifestations of HF.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

2) The nurse is planning care for several clients. Which client should the nurse identify as being at greatest risk of developing heart failure?
A) A 69-year-old black male with hypertension
B) A 50-year-old black female who smokes
C) A 75-year-old white male who is overweight
D) A 52-year-old white female with asthma
Answer: A
Explanation: A) Age above 65, black race, and hypertension lead to an increased risk for developing heart failure. The 69-year-old black male with hypertension has three risk factors.
B) A female who is under age 65 is not at the greatest risk for heart failure despite smoking.
C) Overweight is not a risk factor for heart failure.
D) Asthma is not a risk factor for heart failure.

Learning Outcome: 16.F. Analyze heart failure (HF) as it relates to perfusion. Compare the risk factors and prevention of HF.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

3) The nurse is caring for a child with congestive heart failure (CHF). Which clinical manifestations does the nurse anticipate when assessing this child? **Select all that apply.**
A) Excessive sweating
B) Hypertension
C) Bradycardia
D) Difficulty breathing
E) Increased appetite
Answer: A, D
Explanation: A) Symptoms in children include excessive sweating.
B) Symptoms in children include low blood pressure (not hypertension).
C) Bradycardia is not a typical finding in children with heart failure.
D) Symptoms in children include difficulty breathing.
E) Symptoms in children include poor feeding or growth (not increased appetite).

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

4) During an assessment, a client with left-sided congestive heart failure (CHF) and severe shortness of breath tells the nurse about not having enough money to purchase medications. Which problem is of the greatest initial importance when planning care?
A) Fluid volume excess
B) Inability to manage health
C) Nonadherence to therapeutic plan
D) Inability to tolerate activity
Answer: A
Explanation: A) The client is experiencing acute shortness of breath because of the excess fluid. Fluid volume excess is the priority at this time.
B) Inability to manage health related to the inability to purchase medications should be addressed after the client's physiological problems are resolved.
C) Nonadherence to therapeutic plan related to the inability to purchase medications should be addressed after the client's physiological problems are resolved.
D) Inability to tolerate activity will improve once the fluid volume excess is addressed.

5) The nurse is assessing a client being treated for congestive heart failure (CHF). Which physical findings would indicate that the client's condition is deteriorating? **Select all that apply.**
A) Urine output 160 ml over 8 hours
B) Pulse oximetry reading of 96%
C) Temperature of 98.6°F (37°C)
D) Wheezing of breath sounds in all lobes
E) Moderate amount of clear, thin mucus
Answer: A, D
Explanation: A) A urine output of less than 30 ml/hour should be reported to the healthcare provider and is an indication of a worsening of CHF.
B) A pulse oximetry reading of 96% is a normal finding.
C) A temperature reading of 98.6°F is a normal finding.
D) Wheezing heard when assessing breath sounds is indicative of abnormal breath sounds, which are characteristic in CHF.
E) Moderate clear mucus is a normal finding.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

6) A client is prescribed enalapril (Vasotec) for treatment of heart failure. Which adverse effect should the nurse assess for following the initial administration of this drug?
A) Jaundice
B) Ototoxicity
C) Low blood pressure
D) Blurred vision
Answer: C
Explanation: A) Jaundice is an adverse effect of diuretics.
B) Ototoxicity is an adverse effect of diuretics.
C) Severe hypotension can occur after the initial administration of enalapril (Vasotec).
D) Blurred vision is a sign of digitalis toxicity.
Page Ref: 1290

Learning Outcome: 16.F. Analyze heart failure (HF) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with HF.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

7) The nurse is positioning a client with left-sided heart failure in bed. Which sleeping position is most appropriate for this client?
A) Reclining with 3 pillows under head
B) Lying on the left side with 1 pillow under head
C) Lying supine with 1 pillow under head
D) Lying in the Sims position with 2 pillows under head
Answer: A
Explanation: A) The client with left-sided cardiac failure could develop orthopnea. Being in an upright position with 3 pillows under the head will ease the work of breathing.
B) Lying on the left side, will not help alleviate or prevent the development of orthopnea.
C) Lying supine will not help alleviate or prevent the development of orthopnea.
D) Lying in the Sims position, even with 1-2 pillows, will not help alleviate or prevent the development of orthopnea.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

8) The nurse is assessing a client. Which condition should the nurse recognize as a noncardiac risk factor for heart failure?
A) Myocardial Infarction
B) Hypertension
C) Hyperthyroidism
D) Congenital Heart Defects
Answer: C
Explanation: A) Heart failure may be caused by acute cardiac events such as myocardial function.
B) Heart failure may be caused by acute cardiac events such as conditions causing increased cardiac workload (hypertension).
C) Heart failure may be caused by noncardiac conditions, such as hyperthyroidism.
D) Heart failure may be caused by acute cardiac events such as conditions causing increased cardiac workload (congenital defects).

Learning Outcome: 16.F. Analyze heart failure (HF) as it relates to perfusion. Describe the etiology of HF.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

9) Which statement is true about the physiology of neuroendocrine compensatory mechanism?
A) Increased venous return increases ventricular filling and myocardial stretch, increasing the force of contraction.
B) Decreased cardiac output stimulates the sympathetic nervous system and catecholamine release.
C) Increased renal perfusion stimulates the renin-angiotensin system.
D) Antidiuretic hormone is released from the adrenal gland.
Answer: B
Explanation: A) In the Frank-Starling mechanism, increased venous return increases ventricular filling and myocardial stretch, increasing the force of contraction.
B) In the neuroendocrine response, the cardiac output is decreased. This stimulates the sympathetic nervous system, causing catecholamine release.
C) Decreased cardiac output combined with decreased renal perfusion stimulates the renin-angiotensin system.
D) Antidiuretic hormone is released from the posterior pituitary.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

10) A client with heart failure is admitted to the hospital for the placement of an implantable defibrillator. The client appears comfortable at rest but displays dyspnea with activities of daily living (ADLs). In which way should the nurse classify this client's heart failure?
A) Class I
B) Class II
C) Class III
D) Class IV
Answer: C
Explanation: A) In class I, the client has no limitations in physical activity.
B) In class II the client has some physical limitations due to fatigue.
C) This client has class III heart failure, or moderate heart failure. In this stage, the client is comfortable at rest but displays dyspnea with less than normal physical activity. Also, in this stage, surgical intervention includes implantation of a defibrillator.
D) In class IV, any physical activity causes discomfort.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

11) The nurse is planning care for a client with systolic heart failure. Which pathophysiology should the nurse recall about this condition?
A) Occurs when the ventricle fails to contract adequately to eject a sufficient volume of blood into the arterial system
B) Results when the heart cannot completely relax in diastole, disrupting normal filling
C) Decreases passive diastolic filling, increasing the importance of atrial contraction to preload
D) Results from decreased ventricular compliance caused by hypertrophic and cellular changes and impaired relaxation of the heart muscle
Answer: A
Explanation: A) Systolic heart failure occurs when the ventricle fails to contract adequately to eject a sufficient volume of blood into the arterial system.
B) Inability of the heart to relax in diastole describes diastolic heart failure.
C) Decreased passive diastolic filling occurs in diastolic heart failure.
D) Decreased ventricular compliance occurs in diastolic heart failure.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with heart failure.

12) The nurse is counseling a female client who wants to become pregnant. The client was diagnosed with heart failure 3 years ago and has class II heart failure. What information should the nurse include when teaching related to pregnancy and heart failure?
A) Women with class II heart failure should not attempt to become pregnant.
B) Women with class II heart failure should receive additional monitoring during pregnancy.
C) Women with class II heart failure should take ACE inhibitors during the pregnancy.
D) Women with class II heart failure should stop taking diuretics during the pregnancy.
Answer: B
Explanation: A) Women with stage II heart failure may be able to carry and deliver a baby.
B) Women with stage II heart failure should be counseled about risk prior to becoming pregnant and should be carefully monitored during pregnancy and the postpartum period.
C) ACE inhibitors are contraindicated during pregnancy due to potential adverse effects on the fetus.
D) Diuretics are commonly prescribed for pregnant women with heart failure, especially if pulmonary edema is present.

Exemplar 16.G Hypertension

1) A client reports morning headaches that extend into the neck and go away as the day wears on. Based on this initial data, which assessment finding does the nurse anticipate?
A) Elevated blood pressure
B) Tachycardia
C) Otitis media
D) Swollen lymph nodes
Answer: A
Explanation: A) A headache, generally in the back of the head and neck, that is present on awakening and subsides during the day is an early sign of hypertension. The nurse would expect that the client's blood pressure would be elevated.
B) This type of headache is not directly associated with tachycardia.
C) This type of headache is not directly associated with otitis media.
D) This type of headache is not directly associated with swollen lymph nodes.
Page Ref: 1303
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Identify the clinical manifestations of HTN.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

2) The nurse teaches a client about lifestyle modifications to help manage hypertension. Which client statement indicates teaching has been effective?

A) "I won't be able to run in marathons anymore."
B) "I know I need to give up my cigarettes and alcohol."
C) "I need to get started on my medications right away."
D) "My father had hypertension, did nothing, and lived to be 90 years old."

Answer: B

Explanation: A) Increasing physical activity is an important lifestyle modification for controlling hypertension.

B) Limiting intake of alcohol and discontinuing tobacco products are important nonpharmacologic methods for controlling hypertension.

C) Implementing lifestyle modifications may eliminate the need for pharmacotherapy, so the client may not have to take medication right away.

D) The fact that the client's father had hypertension and lived to be 90 years old does not mean that the client will have the same experience; the client is in denial.

Page Ref: 1302

Cognitive Level: Analyzing

Client Need/Sub: Physiological Integrity

Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Evaluation

Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with HTN.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

3) The nurse is caring for a client who has not been adhering to treatment with antihypertension medication. Which approach to addressing this issue should the nurse use?
A) Indifference
B) Nonjudgmental
C) Demanding
D) Confrontational
Answer: B
Explanation: A) Indifference will likely elicit a negative response from the client, and the client will be less likely to change his behavior.
B) The nurse who listens to the client openly and nonjudgmentally will both validate the client's self-esteem and communicate the idea of partnership in the treatment plan for the client.
C) A demanding attitude will likely elicit a negative response from the client, and the client will be less likely to change his behavior.
D) A confrontational attitude will likely elicit a negative response from the client, and the client will be less likely to change his behavior.
Page Ref: 1309
Cognitive Level: Applying
Client Need/Sub: Psychosocial Integrity
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Apply the nursing process in providing culturally competent care to an individual with HTN.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

WwW.TeSm.Ws

4) An older adult client receiving medication for hypertension had a recent fall at home. Which intervention should the nurse include in this client's plan of care?
A) Monitor serum sodium levels
B) Assess postural blood pressures
C) Monitor serum creatinine levels
D) Monitor blood pressure every 2 hours
Answer: B
Explanation: A) Sodium levels assess renal function.
B) Baroreceptors are less efficient with aging. Therefore, orthostatic hypotension is more likely to occur. Also, clients treated for hypertension could have an increase in sensitivity to the medications. Postural blood pressure assessment allows the nurse to prevent orthostatic hypotension and falls.
C) Creatinine levels assess renal function.
D) Every 2 hours is too frequent for assessments of a noncritical client.
Page Ref: 1309
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning
Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Differentiate care of patients with hypertension (HTN) across the lifespan.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

5) The nurse instructs a client about the medication nifedipine (Procardia) for hypertension. Which client statement indicates that additional teaching is needed?
A) "This medication will cause my ankles to swell, which is normal."
B) "I need to drink 6 to 8 glasses of water each day."
C) "I will call my doctor if I gain weight or become short of breath."
D) "I need to eat foods high in fiber when taking this medication."
Answer: A
Explanation: A) Swelling in the feet or ankles when taking this medication should be reported to the healthcare provider.
B) This medication can cause constipation, so drinking 6 to 8 glasses of water each day is appropriate.
C) The client should notify the healthcare provider of weight gain or shortness of breath.
D) This medication can cause constipation, so increasing fiber in the diet is appropriate.
Page Ref: 1306
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.7 Evaluate outcomes of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Evaluation
Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with HTN.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

6) The nurse is caring for a client with hypertension. Which diagnostic tests should the nurse anticipate being ordered to rule out secondary causes? **Select all that apply.**
A) Cerebral angiogram
B) Intravenous pyelogram
C) Renal ultrasonography
D) Cardiac catheterization
E) Myelogram
Answer: B, C
Explanation: A) Cerebral angiogram is not a diagnostic test to determine the cause for secondary hypertension.
B) When secondary hypertension is suspected, diagnostic tests include an intravenous pyelogram to determine if the renal system is the cause of the hypertension.
C) When secondary hypertension is suspected, diagnostic tests include renal ultrasonography to determine if the renal system is the cause of the hypertension.
D) Cardiac catheterization is not a diagnostic test to determine the cause for secondary hypertension.
E) Myelogram is not a diagnostic test to determine the cause for secondary hypertension.
Page Ref: 1304
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.5 Develop a plan of care. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Planning

Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with HTN.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

7) A client has a blood pressure of 142/92 mmHg. Which classification is appropriate for the nurse to use when documenting this data?
A) Normal
B) Stage 2
C) Elevated
D) Stage 1
Answer: B
Explanation: A) Normal blood pressure is less than 120/80.
B) Stage 2 hypertension is systolic at least 140 or diastolic at least 90.
C) Elevated blood pressure is systolic from 120-129 and diastolic less than 80.
D) Stage 1 hypertension is systolic from 130-139 or diastolic from 80-89.
Page Ref: 1299
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Describe the pathophysiology of HTN.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

8) Which statement best describes the effects of the renal system on blood pressure?
A) "The release of the catecholamines epinephrine and norepinephrine cause an increase in blood pressure."
B) "The release of renin causes an increase in blood pressure."
C) "The release of atrial natriuretic peptide (ANP) and brain natriuretic peptide (BNP) cause an increase in blood pressure."
D) "The synthesis and release of adrenomedullin causes an increase in blood pressure."
Answer: B
Explanation: A) A drop in renal perfusion stimulates renin release. Renin converts angiotensinogen to angiotensin I, which is then converted to angiotensin II in the lungs. Angiotensin II is a vasoconstrictor and also promotes sodium and water retention, raising blood pressure. Catecholamines help regulate blood pressure, but they are not released from the kidneys.
B) A drop in renal perfusion stimulates renin release. Renin converts angiotensinogen to angiotensin I, which is then converted to angiotensin II in the lungs. Angiotensin II is a vasoconstrictor and also promotes sodium and water retention, raising blood pressure.
C) ANP and BNP help regulate blood pressure, but they are not released from the kidneys.
D) Adrenomedullin helps regulate blood pressure, but it is not released from the kidneys.
Page Ref: 1300

Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Describe the pathophysiology of HTN.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

9) A client with primary hypertension is prescribed terazosin (Hytrin) to treat this condition. Which statement explains the mechanism of action of this drug?
A) Prevents conversion of angiotensin I to angiotensin II
B) Prevents beta-receptor stimulation in the heart
C) Inhibits the flow of calcium ions across the cell membrane of vascular tissue and cardiac cells
D) Blocks alpha-receptors in the vascular smooth muscle
Answer: D
Explanation: A) ACE inhibitor medications prevent conversion of angiotensin I to angiotensin II.
B) Beta-adrenergic blockers prevent beta-receptor stimulation in the heart.
C) Calcium channel blockers inhibit the flow of calcium ions across the cell membrane of vascular tissue and cardiac cells.
D) Terazosin (Hytrin), an alpha-adrenergic blocker, acts by blocking alpha-receptors in the vascular smooth muscle.
Page Ref: 1304
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Pharmacological and Parenteral Therapies
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with HTN.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

10) Which risk factor for hypertension is modifiable?
A) Age
B) Ethnicity
C) Family history
D) Tobacco use
Answer: D
Explanation: A) Age is a nonmodifiable risk factor for hypertension.
B) Ethnicity is a nonmodifiable risk factor for hypertension.
C) Family history is a nonmodifiable risk factor for hypertension.
D) Hypertension has many modifiable risk factors, including tobacco use, high sodium intake, obesity, excess alcohol consumption, and low activity level.
Page Ref: 1302
Cognitive Level: Remembering
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Compare the risk factors and prevention of HTN.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

11) Which physiological changes associated with aging increase the risk of hypertension in older adults?

A) Increase in systolic blood pressure
B) Increase in diastolic blood pressure
C) Increase in the pulse pressure
D) Decrease in the diastolic blood pressure
Answer: A
Explanation: A) An age-related increase in the systolic blood pressure is the primary factor leading to the high incidence of hypertension in older adults.
B) The diastolic blood pressure tends to rise until approximately age 50 and then declines.
C) The pulse pressure, which is the difference between the systolic and diastolic blood pressures, does not determine hypertension status.
D) A decrease in diastolic blood pressure does not cause HTN.
Page Ref: 1308-1309
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Describe the etiology of HTN.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

12) Which strategy helps prevent hypertension?
A) Increase salt intake
B) Reduce physical activity
C) Decrease stress
D) Take hot baths
Answer: C
Explanation: A) Reducing salt intake helps prevent hypertension.
B) Increasing physical activity helps prevent hypertension.
C) Decreasing stress helps prevent hypertension.
D) Baths that are too hot can increase blood pressure.
Page Ref: 1302
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Compare the risk factors and prevention of HTN.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

13) The nurse is caring for a 13-year-old female with a BMI of 30.4. When taking the child's vital signs, the nurse documents a blood pressure of 121/83. In which way would this blood pressure be categorized for this client?

A) Normal blood pressure
B) Primary hypertension
C) Secondary hypertension
D) Hypotension

Answer: B

Explanation: A) For a 13-year-old female, the systolic blood pressure should be between 96-103 mmHg and the diastolic blood pressure should be between 58-61 mmHg. This is not a normal blood pressure for the client.

B) Primary hypertension in a client of this age is often associated with obesity. A BMI of 30.4 is categorized as obese.

C) Secondary HTN is often associated with kidney, heart, or endocrine abnormalities. There is no evidence of these conditions in the client.

D) Hypertension is defined as having blood pressure above the 95th percentile.

Page Ref: 1308

Cognitive Level: Applying

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment

Learning Outcome: 16.G. Analyze hypertension (HTN) as it relates to perfusion. Differentiate care of patients with HTN across the lifespan.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with hypertension.

Exemplar 16.H Hypertensive Disorders in Pregnancy

1) The nurse is assessing a client who is in the third trimester of pregnancy. Which finding would require immediate intervention by the nurse?
A) Blood pressure of 142/92 mmHg
B) Pulse of 92 beats per minute
C) Respiratory rate of 24 per minute
D) Weight gain of 16 oz per week
Answer: A
Explanation: A) A pregnant client's blood pressure should not be greater than 140/90 mmHg, and if it is elevated, it could be a sign of gestational hypertension or preeclampsia.
B) The pregnant client's heart rate will increase slightly as a result of an increased circulatory volume and a decrease in intrathoracic space.
C) The pregnant client's respiratory rate will increase slightly as a result of an increased circulatory volume and a decrease in intrathoracic space.
D) Weight gain should average a pound per week in the second and third trimesters.
Page Ref: 1312
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Describe the pathophysiology of hypertensive disorders of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

2) The nurse is assessing a client who is 20 weeks pregnant. Which health issue should the nurse recognize as increasing this client's risk for the development of preeclampsia?
A) Treatment for vitamin D deficiency
B) Surgery for ruptured appendix 1-year prior
C) Fibrocystic breast disease
D) Diabetes
Answer: D
Explanation: A) Treatment for vitamin D deficiency does not increase the risk for preeclampsia.
B) Previous surgeries will not increase the risk for preeclampsia.
C) Fibrocystic breast disease does not increase the risk for preeclampsia.
D) One risk factor for the development of preeclampsia is diabetes.
Page Ref: 1313
Cognitive Level: Analyzing
Client Need/Sub: Health Promotion and Maintenance: Reduction of Risk Potential
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Compare the risk factors and prevention of hypertensive disorders of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

3) The nurse identifies assessment findings for a client with preeclampsia. Blood pressure is 158/100 mmHg; urinary output 50 mL/hour; crackles in the lungs on auscultation; urine protein 1+; 1+ edema hands, feet, ankles. On the next hourly assessment, which new assessment finding would indicate worsening of the condition?
A) Blood pressure 159/100 mmHg
B) Urinary output 40 mL/hour
C) Urine protein 2+
D) Lungs clear to auscultation
Answer: C
Explanation: A) The blood pressure increase is not significant.
B) Urinary output is still greater than 30 mL/hour, so this is not concerning yet.
C) The assessment finding most abnormal is the increase in urine protein. This indicates worsening of the condition.
D) Lungs clear to auscultation is an improvement in the client's condition.
Page Ref: 1313
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment

Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Identify the clinical manifestations of hypertensive disorders of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

4) During a routine prenatal visit, a client who is 24 weeks pregnant has a blood pressure of 143/91. The client's blood pressure at her previous visit was 121/82. A urine dipstick test reveals a trace amount of protein. The nurse identifies which problem as appropriate for the client at this time?
A) Fluid volume excess
B) Potential for injury
C) Difficulty with breastfeeding
D) Anxiety
Answer: A
Explanation: A) The rise in blood pressure and protein in the urine could indicate that preeclampsia is developing. Because preeclampsia is often accompanied by fluid retention, the client would be at risk for fluid volume excess.
B) There is no evidence that the client is at risk for an injury.
C) The client has not delivered yet and would not have difficulty with breastfeeding.
D) Anxiety can be addressed after the client's physiologic problems are addressed.
Page Ref: 1316

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Diagnosis
Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with a hypertensive disorder of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

WW.TBSM.WS

5) The community nurse is caring for a client who is 32 weeks pregnant and diagnosed with preeclampsia. Which statement indicates that the client requires additional teaching?
A) "It is normal for my urine to become darker and smaller in amount each day."
B) "I should call the doctor if I develop a headache or blurred vision."
C) "Pain in the top of my abdomen is a sign my condition is worsening."
D) "Lying on my left side as much as possible is good for the baby."
Answer: A
Explanation: A) Oliguria is a complication of preeclampsia caused by renal involvement and is a sign that the condition is worsening. It is not an expected outcome and should be reported to the physician.
B) Headache and blurred vision or other visual disturbances are an indication of worsening preeclampsia and should be reported to the physician.
C) Epigastric pain is an indication of liver enlargement, a symptom of worsening preeclampsia, and should be reported to the physician.
D) Left lateral position maximizes uterine and renal blood flow, and therefore is the optimal position for a client with preeclampsia.
Page Ref: 1314
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment

Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with a hypertensive disorder of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

6) The nurse is providing postpartum care for a client who gave birth by cesarean section several hours ago. The client had preeclampsia during the last 3 weeks of pregnancy. Which interventions are appropriate for this client within the first 48 hours after birth? **Select all that apply.**
A) Assessment of deep tendon reflexes
B) Assessment of intake and output
C) Oxygen 2 liters nasal cannula as prescribed
D) Seizure precautions
E) Vital sign assessment
Answer: A, B, D, E
Explanation: A) Nursing management during the postpartal period includes deep tendon reflexes.
B) Nursing management during the postpartal period includes intake and output assessment.
C) Oxygen is not usually indicated after delivery.
D) Even though the client with preeclampsia usually improves rapidly after giving birth, seizures can still occur during the first 48 hours postpartum.
E) Nursing management during the postpartal period includes vital sign assessment.
Page Ref: 1315
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a hypertensive disorder of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

7) A client with preeclampsia begins to demonstrate manifestations of seizure activity. Which intervention by the nurse is most likely to protect the client and fetus from injury?

A) Elevate the client's legs
B) Place the client on the left side and protect the airway
C) Place the client in the supine position
D) Elevate the head of the bed

Answer: B

Explanation: A) The client's legs should not be elevated.

B) The client should be placed on the side to aid in circulation to the placenta. The airway needs to be maintained to ensure oxygenation throughout the seizure.

C) The client should not be placed in the supine position.

D) The head of the bed should not be elevated.

Client Need/Sub: Physiological Integrity: Reduction of Risk Potential

Standards: QSEN Competencies: III.A.2 Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation

Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with a hypertensive disorder of pregnancy.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

8) The nurse is teaching a group of pregnant clients regarding seizures associated with eclampsia. Which statement associated with eclampsia is accurate?
A) "The tonic phase of a grand mal seizure is evidenced by alternate contraction and relaxation of the muscles."
B) "The clonic phase of a grand mal seizure is evidenced by muscular contraction and rigidity."
C) "Seizures are rare in eclampsia, but they occur sometimes."
D) "Seizures do not occur in preeclampsia."
Answer: D
Explanation: A) The tonic phase of a grand mal seizure is evidenced by muscular contraction and rigidity.
B) The clonic phase of a grand mal seizure is evidenced by alternate contraction and relaxation of the muscles.
C) Seizures do not occur in preeclampsia; eclampsia is diagnosed once a client has a seizure, so seizures are not rare in eclampsia.
D) Seizures do not occur in preeclampsia; eclampsia is diagnosed once a client has a seizure, so seizures are not rare in eclampsia.

9) The nurse is caring for a client with preeclampsia. Which laboratory value does the nurse anticipate for this client?
A) Increased platelet count
B) Decreased liver enzymes
C) Decreased blood urea nitrogen (BUN)
D) Increased serum creatinine
Answer: D
Explanation: A) Preeclampsia can cause a decrease in platelet count.
B) Preeclampsia can cause an increase in liver enzymes.
C) Preeclampsia decreases renal perfusion, causing an increase in blood urea nitrogen (BUN).
D) Preeclampsia decreases renal perfusion, causing an increase in serum creatinine.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Identify the clinical manifestations of hypertensive disorders of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

10) A pregnant client is diagnosed with HELLP syndrome. Based on this diagnosis, which laboratory findings are consistent with diagnosis of HELLP?
A) Decreased liver enzymes
B) Hemolysis
C) Elevated lipid panel
D) Increased platelet count
Answer: B
Explanation: A) HELLP syndrome causes elevated liver enzymes.
B) HELLP syndrome causes hemolysis.
C) An elevated lipid panel is not a characteristic of HELLP syndrome.
D) HELLP syndrome causes a low platelet count.
Page Ref: 1313
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Identify the clinical manifestations of hypertensive disorders of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

11) Which action should the nurse carry out for the laboring client who has been diagnosed with preeclampsia?
A) Place the client in the room closest to the nurse's station, even if it is a shared room.
B) Place the client in left lateral position when the client feels the urge to push.
C) Monitor client's fetus intermittently while client is in first stage of labor.
D) Encourage the client to be alone in the room without family in order to maintain a quiet environment.
Answer: B
Explanation: A) If possible, the nurse should place the client in a private room to promote a nonstimulating environment.
B) A laboring client with preeclampsia is at risk for the development of eclampsia with subsequent seizures. The nurse should place the client in left lateral position because this position improves circulation to the placenta and fetus; the client should remain in this position when pushing if possible.
C) The nurse will monitor the client's fetus continuously during labor.
D) The client should always have support and not be alone during labor.
Page Ref: 1317
Cognitive Level: Applying
Client Need/Sub: Physiological Integrity: Basic Care and Comfort
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with a hypertensive disorder of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

12) Which situation is believed to be the cause of preeclampsia?
A) Placental dysfunction
B) Liver disease
C) Anxiety
D) Low sodium intake
Answer: A
Explanation: A) The exact cause of preeclampsia is unknown. However, it has been identified as a disorder of placental dysfunction leading to a syndrome of endothelial dysfunction with associated vasospasm.
B) Eclampsia is not caused by liver disease.
C) Eclampsia is not caused by anxiety.
D) Eclampsia is not caused by low sodium intake.
Page Ref: 1312
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Describe the etiology of hypertensive disorders of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

13) The nurse is caring for a pregnant client who is hypertensive. Which additional clinical manifestation leads the nurse to believe that the client is experiencing early preeclampsia?
A) Persistent headache
B) Excessive protein in the urine
C) Right-sided abdominal pain
D) Severe epigastric pain
Answer: B
Explanation: A) Later symptoms include persistent headache.
B) Early signs of preeclampsia include protein in the urine.
C) Later symptoms include right-sided abdominal pain.
D) Severe epigastric pain is a symptom of HELLP syndrome.
Page Ref: 1313
Cognitive Level: Understanding
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment
Learning Outcome: 16.H. Analyze hypertensive disorders of pregnancy as they relate to perfusion. Identify the clinical manifestations of hypertensive disorders of pregnancy.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with a hypertensive disorder in pregnancy.

Exemplar 16.I Life-Threatening Dysrhythmias

1) During a blood pressure screening, an older adult client tells the nurse about chest fluttering while doing yard work. The client reports no other symptoms, and the frequency is intermittent. Which action is correct by the nurse?
A) Suggest the client stop exercising
B) Reassure these are normal changes associated with aging
C) Ensure the client is evaluated by their medical provider
D) Check laboratory values for hypothyroidism
Answer: C
Explanation: A) Exercise intolerance would include shortness of breath, which the client does not report.
B) These symptoms are not normal cardiac changes.
C) New-onset dysrhythmias may signal the onset of a serious underlying illness that requires further medical evaluation.
D) Chest fluttering can be a sign of hyperthyroidism, not hypothyroidism.
Page Ref: 1327
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.2 Communicate effectively with individuals. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Differentiate care of patients with life-threatening dysrhythmias across the lifespan.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

2) The nurse is assessing an adult client with a cardiac dysrhythmia. Which finding would the nurse identify as possibly contributing to this client's dysrhythmia?

A) Drinks caffeinated coffee in the morning and for lunch

B) Does not smoke or ingest any alcohol

C) Plays golf three times a week and gardens daily

D) Takes antihypertensive medication as prescribed

Answer: A

Explanation: A) Caffeine increases the risk of ectopic beats and rapid heart rates.

B) The client is a non-smoker and does not ingest alcohol, both of which would contribute to cardiac dysrhythmias.

C) Engaging in routine physical activity will not cause dysrhythmias or conduction defects.

D) Antihypertensive medications are not associated with cardiac dysrhythmias.

Page Ref: 1324

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.3 Integrate assessment skills in practice. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Assessment

Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Compare the risk factors and prevention of life-threatening dysrhythmias.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

3) An adult client is experiencing paroxysmal supraventricular tachycardia. Which nursing interventions are appropriate based on the data provided? **Select all that apply.**
A) Initiate oxygen therapy
B) Prepare for cardioversion
C) Begin anticoagulation therapy as prescribed
D) Administer intravenous adenosine as prescribed
E) Administer a beta blocker as prescribed
Answer: A, B, D, E
Explanation: A) Management of paroxysmal supraventricular tachycardia includes oxygen therapy.
B) Management of paroxysmal supraventricular tachycardia includes synchronized cardioversion.
C) Anticoagulant therapy is not a part of the management for this dysrhythmia.
D) Management of paroxysmal supraventricular tachycardia includes adenosine.
E) Management of paroxysmal supraventricular tachycardia includes beta blockers.

4) A client with a cardiac dysrhythmia reports being easily fatigued and has difficulty performing normal daily activities. Which problem should the nurse select to address this client's issue?
A) Excessive amount of body fluid
B) Inability to tolerate activity
C) Fear
D) Inability to perform self-care
Answer: B
Explanation: A) There is no evidence that the client is experiencing excess fluid volume.
B) The client is experiencing fatigue and frustration with the inability to perform normal daily activities. The problem to address this client's issue would be inability to tolerate activity.
C) There is no evidence that the client is experiencing fear.
D) There is no evidence that the client has the inability to perform self-care.
Page Ref: 1336
Cognitive Level: Analyzing
Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: I.A.1. Integrate understanding of multiple dimensions of patient-centered care: Patient/family/community preferences, values; Coordination and integration of care; Information, communication, and education; Physical comfort and emotional support; Involvement of family and friends; Transition and continuity. | AACN Domains and Competencies: 2.4 Diagnose actual or potential health problems and needs. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Diagnosis
Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with a life-threatening dysrhythmia.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

5) The nurse is planning care for a client with a cardiac dysrhythmia. Which action would be the most appropriate for this client?

A) Restrict fluids

B) Encourage bedrest

C) Monitor serum electrolyte levels

D) Instruct on a low-fat diet

Answer: C

Explanation: A) There is no evidence to suggest the client needs to have fluids restricted.

B) More information is needed before determining whether the client needs to be on bedrest.

C) The nurse should monitor serum electrolyte levels because electrolyte imbalances affect cardiac depolarization and repolarization and may cause dysrhythmias.

D) There is no evidence to suggest the client needs instruction on a low-fat diet.

Client Need/Sub: Physiological Integrity: Physiological Adaptation

Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation

Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Apply the nursing process in providing culturally competent care to an individual with a life-threatening dysrhythmia.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

6) A client is receiving procainamide hydrochloride for treatment of a dysrhythmia. Which is an appropriate client outcome related to adhering to the provided medication instruction?

A) The client will monitor the pulse and not take the medication if the pulse is less than 60.

B) The client will take the medication as directed, even when feeling well.

C) The client will take the medication on an empty stomach.

D) The client will take the medication with food.

Answer: B

Explanation: A) The beta-adrenergic blocking drugs cause bradycardia, not group 1A cardiac antiarrhythmic drugs like procainamide hydrochloride.

B) It is very important for clients to understand that medication must be taken as directed, even if the client is feeling well.

C) Procainamide hydrochloride can be taken on an empty stomach.

D) Procainamide hydrochloride can be taken with food.

Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a life-threatening dysrhythmia.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

7) A client is scheduled for temporary pacemaker insertion. Which instruction will this client need prior to discharge?
A) Dizziness is to be expected.
B) There are no special precautions.
C) Wear a tight-fitting shirt to help hold the pacemaker in place.
D) Use battery-powered equipment.
Answer: D
Explanation: A) Dizziness is not to be expected and should be reported to the healthcare provider.
B) There are special precautions that the client needs to take.
C) The client should wear loose-fitting clothing.
D) When available, battery-powered equipment should be used instead of electrical equipment.

Standards: QSEN Competencies: III.A.1. Demonstrate knowledge of basic scientific methods and processes. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a life-threatening dysrhythmia.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

8) A client with sepsis has a temperature of 40°C. Which dysrhythmia is most likely to occur in this client?
A) Bradydysrhythmia
B) Tachydysrhythmia
C) Wolff-Parkinson-White dysrhythmia
D) Long QT dysrhythmia
Answer: B
Explanation: A) Fever does not cause bradydysrhythmias.
B) Stressors such as fever, sepsis, and hyperthyroidism may precipitate paroxysmal supraventricular tachycardia, which is a tachydysrhythmia.
C) Wolff-Parkinson-White is caused by genetic cardiac problems.
D) Long QT is caused by genetic cardiac problems.

Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Identify the clinical manifestations of life-threatening dysrhythmias.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

9) The nurse notes that a client is experiencing a ventricular tachycardia dysrhythmia. Which rhythm is a type of ventricular tachycardia?
A) Sinus tachycardia
B) Atrial flutter
C) Junctional escape
D) Torsades de Pointes
Answer: D
Explanation: A) Sinus tachycardia is a supraventricular rhythm, not a ventricular rhythm.
B) Atrial flutter is not a ventricular rhythm.
C) Junctional escape rhythm is not a ventricular rhythm.
D) Torsades de Pointes is a type of ventricular tachycardia.

Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Identify the clinical manifestations of life-threatening dysrhythmias.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

10) The nurse is participating in the resuscitation of a client experiencing sudden cardiac death. After five cycles of CPR, the nurse evaluates the client's cardiac rhythm as asystole. Which action should the nurse take next?
A) Administer epinephrine
B) Immediately defibrillate the client
C) Assess the cardiac monitor electrodes
D) Assess the client's pulse
Answer: D
Explanation: A) Epinephrine is not given next.
B) Defibrillation is not indicated.
C) Cardiac monitor electrodes should not be on the client.
D) According to the American Heart Association (AHA) CPR guidelines, after five rounds of CPR, the nurse should assess the client's pulse. All other choices are incorrect actions by the nurse.

Client Need/Sub: Physiological Integrity: Physiological Adaptation
Standards: QSEN Competencies: III.A.2. Describe evidence-based practice to include the components of research evidence, clinical expertise and patient/family values. | AACN Domains and Competencies: 2.6 Demonstrate accountability for care delivery. | NLN Competencies: Knowledge and Science: Relationships between knowledge/science and quality and safe client care. | Nursing Process: Implementation
Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Summarize diagnostic tests and therapies used by interprofessional teams in the collaborative care of an individual with a life-threatening dysrhythmia.
MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

11) Which property of cardiac cells is mechanical in nature?
A) Automaticity
B) Excitability
C) Conductivity
D) Contractility
Answer: D

Explanation: A) Automaticity is the capability of pacemaker cells to initiate an electrical impulse or action potential.

B) Excitability is the capability of heart muscle cells to respond to electrical stimulation from the pacemaker cells.

C) Conductivity is the capability of myocardial cells to transfer the electrical impulses from cell to cell in a rapid fashion.

D) Contractility is the capability of myocardial fibers to shorten with electrical stimulation. A single muscle fiber stimulation triggers the rest of the muscle mass to contract as a single unit in an all-or-nothing system.

Learning Outcome: 16.I. Analyze life-threatening dysrhythmias as they relate to perfusion. Describe the pathophysiology of life-threatening dysrhythmias.

MNL LO: Demonstrate understanding of the concept of perfusion in the care of a patient with life threatening dysrhythmias.

12) Which dysrhythmia is most commonly associated with sudden cardiac death (SCD)?
A) Atrial flutter
B) Ventricular fibrillation
C) Paroxysmal supraventricular tachycardia
D) Junctional escape rhythm
Answer: B
Explanation: A) Atrial flutter is not associated with SCD.
B) Ventricular fibrillation most commonly leads to sudden cardiac death.
C) Paroxysmal supraventricular tachycardia is not associated with SCD.
D) A junctional escape rhythm is not associated with SCD.
